

Preface

Metaphor and analogy have served as powerful methods in language, cognition, and the history of science for human agents and cultures. Software, robotic, and living agents also show or may take advantage of such methods in interacting with their worlds.

This is a book about ‘crossing the lines’ from one domain into another, and about what can then emerge. The focus of this volume is the phenomena of *meaning transfer* and *meaning construction* between different domains (minds, systems, technologies, cultures, etc.) and their computational structure and design. The tools of transfer include imitation, analogy, metaphor, narrativity and interaction which support mapping, thinking, processing, learning, reasoning, manipulating, surviving or understanding for agents coping with their worlds.

In metaphor, meaning transferred (between different agents or from one realm to another within a single system) may constitute, for example, symbolic or non-representational knowledge, particular sets of behaviors, a structural description or finite-state automaton model of a physical phenomenon, cognitive models and hierarchical categories, coordinate systems affording understanding, or a paradigmatic viewpoint for construction of science or social reality. Meaning is nevertheless only constructed with regard to some situated agent or observer under constraints grounded in the interaction of its own structure and environment. Good mappings and metaphors for situated agents are, moreover, not arbitrary, but their usefulness and quality depend upon the degrees to which they respect such grounding and structural constraints.

This volume brings together the work of researchers from various disciplines where aspects of descriptive, mathematical, computational, or design knowledge concerning metaphor and analogy have emerged. Such areas include, for example, embodied intelligence, robotics, software and virtual agents, semiotics, linguistics, cognitive science, psychology, philosophy, cultural anthropology, history of science, consciousness studies, mathematics, algebraic engineering, and intelligent control.

Computation for Metaphors, Analogy & Agents

CMA² is an international workshop organized and sponsored by the Cybernetics and Software Systems Group and the Software Engineering Laboratory of the University of Aizu and is supported by grants of the Fukushima Prefectural Government, Japan.

Conference General Chair

Shoichi Noguchi University of Aizu, Japan

Scientific Program Chair

Chrystopher Nehaniv University of Aizu, Japan

Advisory Committee

Rodney A. Brooks	MIT Artificial Intelligence Lab, U.S.A.
Joseph Goguen	University of California, San Diego, U.S.A.
Douglas R. Hofstadter	Indiana University, U.S.A.
Alex Meystel	National Institute of Standards and Technology, U.S.A.
Melanie Mitchell	Santa Fe Institute, U.S.A.

International Program Committee

Meurig Beynon	University of Warwick, U.K.
Lawrence Bull	University of the West of England, U.K.
Zixue Cheng	University of Aizu, Japan
Kerstin Dautenhahn	University of Reading, U.K.
Gilles Fauconnier	University of California, San Diego, U.S.A.
Robert M. French	University of Liège, Belgium
Joseph Goguen	University of California, San Diego, U.S.A.
Karsten Henckell	New College, University of South Florida, U.S.A.
Masami Ito	Kyoto Sangyo University, Japan
Jacob L. Mey	Odense University, Denmark
Alex Meystel	National Institute of Standards and Technology, U.S.A.
Chrystopher Nehaniv (Chair)	University of Aizu, Japan
Minetada Osano	University of Aizu, Japan
Thomas S. Ray	ATR Human Information Processing Research Labs, Japan & University of Delaware, U.S.A.
John L. Rhodes	University of California at Berkeley, U.S.A.
Paul Thagard	University of Waterloo, Canada

Local Organizing Committee

Qi-Ming Chen
Zixue Cheng
Tsuyoshi Ishikawa
Yuko Kesen
