

Contents

Notation	XIII
1 Motivation for current research	1
1.1 Results and conclusions from Benchmark calculations	4
1.2 Numerical and algorithmic bottlenecks of CFD tools	16
2 Derivation of Navier–Stokes solvers	27
2.1 Mathematical description of Navier–Stokes solvers	32
2.2 The general “Pressure Schur Complement” approach	38
2.3 “Global Multilevel Pressure Schur Complement”	46
2.3.1 The “reactive” preconditioner A_R	48
2.3.2 The “diffusive” preconditioner A_D	54
2.3.3 The “convective” preconditioner A_K	56
2.3.4 The “factorized” preconditioner	59
2.4 “Local Multilevel Pressure Schur Complement”	67
2.4.1 The local “Pressure Schur Complement” preconditioner	67
2.4.2 Blocking strategies for building patches Ω_i	72
2.5 Resulting schemes and relation to other existing methods	78
3 Other mathematical components	97
3.1 Finite element spaces	98
3.1.1 Criteria for the comparison of various Stokes elements	101
3.1.2 Some properties of the nonconforming rotated multilinear spaces	107
3.1.3 The discretely divergence-free subspaces	115
3.1.4 Stabilization techniques for convective terms	124
3.1.5 A posteriori error control mechanisms for finite element approaches	147
3.2 Time stepping techniques	161
3.2.1 The Fractional-step- θ scheme and other One-step- θ schemes	162

3.2.2	Numerical comparisons of some time discretization schemes	168
3.2.3	Adaptive time stepping for incompressible flow problems	174
3.3	Nonlinear iteration techniques	178
3.3.1	The “adaptive fixed point defect correction” method	181
3.3.2	Numerical aspects of nonlinear (and linear) iteration schemes	189
3.3.3	Linearization techniques for nonstationary flows	203
3.3.4	Other nonlinear techniques for the Navier–Stokes equations	206
3.4	Linear multigrid techniques	208
3.4.1	Linear basic iterations and their properties as smoothers	212
3.4.2	Grid transfer, coarse grid operators and control of correction	218
3.4.3	Numerical examples for multigrid performance	227
3.5	Boundary conditions	247
3.5.1	Variational formulations in unbounded domains	249
3.5.2	Variational formulations in bounded domains	253
3.5.3	Associated boundary conditions of flux and pressure drop type	266
3.5.4	Implementation of boundary conditions	269
4	Numerical comparisons of Navier-Stokes solvers	281
4.1	Some exemplary numerical examples	285
4.2	Conclusions from the numerical simulations	325
5	Conclusions and outlook	335
6	The enclosed CDROM	341
	Bibliography	343

Efficient Solvers for Incompressible Flow Problems

An Algorithmic and Computational Approach

Turek, S.

1999, XV, 358 p. With CD-ROM., Hardcover

ISBN: 978-3-540-65433-9
