I	The Climate System	1
1	The Global and Regional Climate System	3
	by Hans von Storch	
1.1	Prologue	4
1.2	The Global View: Energy Balance Models	7
1.3	The Global Atmospheric Circulation: Emergence from a State at Rest	9
1.4	The Regional Climate: Controlled by Planetary Scales	14
	1.4.1 Conditional Statistical Models	18
	1.4.2 The Case of Rumanian Precipitation	20
	1.4.3 The Case of Short Term Event Statistics	24
1.5	Feedback of Regional Scales on Global Scales	28
	1.5.1 Parameterizations	30
	1.5.2 Randomized Parameterization	31
1.6	Epilogue	35
1.7	Acknowledgements	36
2	Three Dimensional Numerical Simulation of Climate: The Fundamentals	37
	by Warren Washington	
2.1	Introduction	38
2.2	Model Equations	38
2.3	Vertical Coordinate Systems	42
	2.3.1 Solar Radiation	44
	2.3.2 Infrared Radiation	46
	2.3.3 Net Heating/Cooling Rates	46
	2.3.4 Physical Processes	47
	2.3.5 Precipitation and Cloud Processes	49
2.4	Surface Processes	49
	2.4.1 Boundary Fluxes at the Earth's Surface	49
	2.4.2 Examples of Computations of Surface Hydrology	50
2.5	Ocean Models	53
2.6	Sea Ice Models	56
	2.6.1 Ice Dynamics	56
2.7	Suggestions for Interesting Climate Model Websites	58

2.8	Future Development	58
2.9	The Climate System Model and Parallel Climate Model	59
2.10	Acknowledgements	59
3	Hydrological Modeling from Local to Global Scales	61
	by Eric F. Wood	
3.1	Introduction	62
3.2	The Modeling Strategy Across a Range of Scales	64
3.3	Modeling Water and Energy Fluxes Across a Range of Scales	65
3.3.1	Model Testing at Small Scales	68
3.3.2	Recent Model Testing at Medium Scales	71
3.3.3	Recent Model Testing at Global Scales	76
3.4	Remote Sensing of Environmental Forcing Variables	76
3.5	Discussion and Summary	80
3.6	Acknowledgements	80
4	Natural Climate Variability and Concepts of Natural Climate Variability	83
	by Jin-Song von Storch	
4.1	Introduction: Definitions of Climate Variability	85
4.2	Estimation of Frequency-Decomposed Covariances of the Present-Day Climate	95
4.2.1	Univariate Case	96
4.2.2	Multivariate Case	100
4.3	Concepts on the Generation of Temporal Variability	114
4.3.1	Classical Hypotheses and the Concept of Multiple Equilibria: The Origin of Mean $\langle \mathbf{v}(t) \rangle$	115
4.3.2	The Concept of Stochastic Climate Models: The Origin of Covariance $\langle \mathbf{v}'(t)\mathbf{v}'(t)^\dagger \rangle$	121
4.4	Concepts on the Generation of Spatial Variability	124
4.4.1	The General Idea	124
4.4.2	An Example: Identification of Processes Responsible for the Dominant Spatial Features of the Two Anisotropic Modes in the ECHAM1/LSG Atmosphere	125
4.5	Conclusions	133
II	Climate Change	137
5	Weather Modification by Cloud Seeding – A Status Report 1989-1997	139
	by William R. Cotton	
5.1	Introduction	141
5.2	The Static Mode of Cloud Seeding	141
5.3	The Dynamic Mode of Cloud Seeding	145

<i>Contents</i>	xi
-----------------	----

5.4	Hygroscopic Seeding	150
5.5	Weather Modification Research Funding	153
5.6	Lessons Learned that the Global Climate Change Community Should Pay Attention To	153
5.6.1	Hygroscopic Seeding and the CCN-Albedo Hypothesis	154
5.6.2	The Importance of Natural Variability	154
5.6.3	The Dangers of Overselling	155
5.6.4	The Capricious Administration of Science and Technology	156
5.6.5	Scientific Credibility and Advocacy	157
5.7	Should Society Wait for Hard Scientific Evidence?	157
5.8	Acknowledgements	159
6	The Detection of Climate Change	161
	by Francis W. Zwiers	
6.1	Introduction	162
6.2	Basic Ideas	162
6.3	More Elaborate Ideas	170
6.3.1	Changing Natural Variability	170
6.3.2	Taking Sampling Variability Into Account	172
6.3.3	The Power of the Optimal Detector	174
6.4	Signal Patterns and Spaces	174
6.4.1	The Signal Pattern Problem	176
6.4.2	The Signal Space Problem	176
6.4.3	Attribution of Climate Change	177
6.4.4	Applying the Signal Pattern Approach	180
6.4.5	A Signal Space Application	188
6.5	Space-Time Filter Theory	192
6.5.1	The Basic Filter Theory	192
6.5.2	An Application - Detecting the Solar Signal	194
6.5.3	An Extension - More Signals	199
6.6	Detection with Pattern Similarity Measures	199
6.7	Summary	203

III Implications **207**

7	Cooperative and Non-Cooperative Multi-Actor Strategies of Optimizing Greenhouse Gas Emissions	209
	by Klaus Hasselmann	
	PART I: THE SINGLE-ACTOR PROBLEM	211
7.1	Introduction	211
7.2	The Single-Actor SIAM Model	212
7.2.1	The Climate Model	214
7.2.2	Cost Functions	216

7.3	Optimal CO ₂ Emission Paths for the Single-Actor Case . . .	219
7.3.1	Prescribed Scenarios	220
7.3.2	Sensitivity Studies	222
7.4	Summary and Conclusions: Single-Actor Analysis	228
PART II: THE NON-COOPERATIVE MULTI-ACTOR CASE		231
7.5	The Multi-Actor Case	231
7.5.1	n Identical Non-Cooperative Actors	232
7.5.2	The Single Mitigator Problem	235
7.5.3	Trading Actors	237
7.5.4	The Two-Actor Fossil Fuel Producer-Consumer Problem	247
7.6	Summary and Conclusions: Multi-Actor Case	253
7.7	Outlook	254
7.8	Acknowledgements	256
8	"Mastering" the Global Commons	257
	by Nico Stehr	
8.1	Prologue	258
8.2	Overview	258
8.3	Introduction	261
8.4	The Location of Nature	263
8.5	Climate Impact Research	265
8.6	Climate Policies as an Optimal Control Problem?	270
8.7	Linking Nature, the Economy and Society	273
8.8	Summary	278
9	Climate Science and the Transfer of Knowledge to Public and Political Realms	281
	by Dennis Bray and Hans von Storch	
9.1	Collegial Comments	281
9.2	Introduction	283
9.3	The Survey	284
9.4	The Sample	284
9.5	Results	286
9.6	Conclusion	320
9.7	Acknowledgements	322
