## *Course 1. Some Quantitative Aspects of Galactic and Extragalactic Infrared Astronomy*

<i>by M. Harwit</i>	1
<b>1 Introduction</b>	<b>3</b>
<b>2 Energy dissipation in cosmic clouds</b>	<b>3</b>
<b>3 Impurities</b>	<b>4</b>
<b>4 Population of excited states</b>	<b>6</b>
<b>5 Cooling rates</b>	<b>7</b>
<b>6 Grains and ices</b>	<b>10</b>
<b>7 Polycyclic aromatic hydrocarbons</b>	<b>12</b>
<b>8 Grain formation</b>	<b>13</b>
<b>9 Cooling of dense clouds by grain radiation</b>	<b>15</b>
<b>10 The Sunyaev-Zel'dovich effect</b>	<b>16</b>
<b>11 The diffuse extragalactic background, cosmic metallicity, and star formation</b>	<b>17</b>
<b>12 Background observations</b>	<b>19</b>

<b>13 Contributions from discrete sources</b>	<b>20</b>
<b>14 Star formation rates, metallicity, and energy production</b>	<b>21</b>
<b>15 Must most of the energy production have occurred at low red shifts <math>z</math>?</b>	<b>24</b>
15.1 A Single star burnt at red shift $z$ . . . . .	24
15.2 Continuous formation of massive stars . . . . .	25
15.3 Low-mass stars . . . . .	26
15.4 Directly observed star formation . . . . .	26
<b>16 The epoch from which the bulk of the integrated background radiation reaches us</b>	<b>27</b>

*Course 2. Overview of the ISO Mission*

*by M.F. Kessler* 29

<b>1 Introduction</b>	<b>31</b>
<b>2 ISO satellite</b>	<b>32</b>
2.1 Satellite design . . . . .	32
2.2 Satellite observing modes . . . . .	35
2.3 Satellite in-orbit performance . . . . .	35
<b>3 Instrument payload</b>	<b>36</b>
3.1 Overview of instruments . . . . .	36
3.2 The ISO camera: ISOCAM . . . . .	37
3.3 The ISO imaging photopolarimeter: ISOPHOT . . . . .	39
3.4 The ISO short wavelength spectrometer: SWS . . . . .	42
3.5 The ISO long wavelength spectrometer: LWS . . . . .	44
<b>4 Orbit</b>	<b>46</b>
<b>5 Operations</b>	<b>46</b>
5.1 Operations design . . . . .	46
5.2 Observing time . . . . .	48
5.3 Operations performance . . . . .	49
<b>6 Scientific highlights</b>	<b>50</b>
<b>7 The ISO legacy</b>	<b>51</b>
7.1 ISO data in general . . . . .	51
7.2 The ISO data archive . . . . .	52
7.3 Using the ISO data archive . . . . .	55
7.4 Software tools and overall documentation . . . . .	59

7.5 Plans until end 2001 . . . . .	60
<b>8 Conclusions</b>	<b>61</b>

### *Course 3. Data Analysis with ISOCAM*

<i>by J.L. Stark</i>	63
<b>1 Introduction</b>	<b>65</b>
<b>2 ISOCAM data calibration</b>	<b>67</b>
2.1 Cosmic ray impact suppression . . . . .	67
2.2 Dark subtraction for the LW channel . . . . .	70
2.3 Flat field correction . . . . .	71
2.4 Stabilization . . . . .	72
2.5 Jitter . . . . .	73
2.6 Field of view distortion correction . . . . .	73
<b>3 Source detection in ISOCAM images</b>	<b>76</b>
3.1 Introduction . . . . .	76
3.2 Source detection from the wavelet transform . . . . .	77
3.3 ISOCAM faint source detection: The PRETI method . . . . .	79
3.3.1 Introduction . . . . .	79
3.3.2 Calibration from pattern recognition . . . . .	79
3.3.3 Example . . . . .	81
<b>4 Image restoration using the wavelet transform</b>	<b>81</b>
4.1 Image filtering . . . . .	81
4.2 Image deconvolution . . . . .	83
<b>5 Conclusion</b>	<b>87</b>

### *Course 4. ISO Observations of Solar-System Objects*

<i>by T. Encrenaz</i>	89
<b>1 Introduction</b>	<b>92</b>
<b>2 Mars</b>	<b>95</b>
<b>3 Giant planets</b>	<b>102</b>
3.1 The D/H ratio . . . . .	106
3.2 The stratospheres of the giant planets . . . . .	109
3.2.1 External source of oxygen in the giant planets . . . . .	109
3.2.2 Detection of stratospheric hydrocarbons . . . . .	112

3.2.3	Fluorescence emissions in the stratospheres of Jupiter and Saturn . . . . .	115
3.3	The tropospheres of the giant planets . . . . .	115
3.3.1	The 2.7 $\mu\text{m}$ window . . . . .	117
3.3.2	The 7 – 11 $\mu\text{m}$ spectrum of Jupiter and Saturn . . . . .	119
3.3.3	The far-infrared spectrum of Saturn . . . . .	119
3.3.4	The 5- $\mu\text{m}$ spectral window . . . . .	120
<b>4</b>	<b>Pluto</b>	<b>122</b>
<b>5</b>	<b>Titan</b>	<b>123</b>
<b>6</b>	<b>Galilean satellites</b>	<b>126</b>
<b>7</b>	<b>Comet Hale-Bopp (C/1995 O1)</b>	<b>129</b>
<b>8</b>	<b>Short-period comets</b>	<b>133</b>
<b>9</b>	<b>Cometary trails</b>	<b>137</b>
<b>10</b>	<b>Distant comets and Kuiper-Belt objects</b>	<b>139</b>
<b>11</b>	<b>Asteroids</b>	<b>139</b>
<b>12</b>	<b>Zodiacal light</b>	<b>143</b>
<b>13</b>	<b>Conclusions and perspectives</b>	<b>143</b>

*Course 5. Stars and Galactic Structure*

*by H. Habing* 151

<b>1</b>	<b>The complex objects called stars: Well known and still puzzling</b>	<b>153</b>
1.1	Outline of these notes . . . . .	155
<b>2</b>	<b>Red and Brown dwarfs: Stars of very low mass</b>	<b>155</b>
2.1	Calculations of the structure of M-dwarfs and brown giants . . .	156
2.2	How they look like: Spectra of red and brown dwarfs . . . . .	160
2.3	The search for red and brown dwarfs: Strategies and results . . .	161
2.4	Luminosity function . . . . .	163
<b>3</b>	<b>Main-sequence stars: Debris disks and planets</b>	<b>163</b>
3.1	The “Vega-effect” . . . . .	163
3.2	The discovery of planets . . . . .	166
3.3	Remnant disks as observed by ISO . . . . .	168

<b>4</b>	<b>Red giants</b>	<b>170</b>
4.1	Basic properties of red giants: RGB and AGB stars and later episodes . . . . .	171
4.2	Recent calculations of stellar structure and stellar evolution . . .	171
4.3	<i>Ab-initio</i> models of the evolution of AGB stars taking mass loss into account . . . . .	175
4.4	“Synthetic” models of the evolution of AGB stars taking mass loss into account . . . . .	175
4.5	And what about double stars? . . . . .	179
4.6	The impact of new observations, especially, but not exclusively, by ISO . . . . .	179
<b>5</b>	<b>AGB stars in our Milky Way and in the Magellanic Clouds</b>	<b>185</b>
<b>6</b>	<b>Concluding remarks</b>	<b>187</b>

## Course 6. *Star Formation*

by *A. Natta* 193

<b>1</b>	<b>Introduction</b>	<b>197</b>
<b>2</b>	<b>Collapse of molecular cores</b>	<b>198</b>
2.1	Giant molecular clouds and cores . . . . .	198
2.2	Conditions for collapse . . . . .	199
2.3	Free-fall collapse . . . . .	202
2.3.1	Cloud collapse . . . . .	202
2.3.2	Free-fall accretion . . . . .	202
2.4	Collapse of an isothermal sphere of gas . . . . .	203
2.5	Collapse of a slowly rotating core . . . . .	205
<b>3</b>	<b>Observable properties of protostars</b>	<b>207</b>
3.1	Evidence of infall from molecular line profiles . . . . .	207
3.2	SEDs of protostars . . . . .	208
3.3	The line spectrum of a protostar . . . . .	211
<b>4</b>	<b>Protostellar and pre-main-sequence evolution</b>	<b>213</b>
4.1	The protostellar phase . . . . .	213
4.2	Pre-main-sequence evolution . . . . .	213
4.3	The birthline . . . . .	214
<b>5</b>	<b>Circumstellar disks</b>	<b>216</b>
5.1	Accretion disks . . . . .	216
5.2	Properties of steady accretion disks . . . . .	217
5.2.1	The velocity field . . . . .	217
5.2.2	Timescales . . . . .	219

5.2.3	Temperature profile and luminosity . . . . .	219
5.2.4	Density structure . . . . .	220
5.3	Reprocessing disks . . . . .	221
5.4	Disk-star interaction . . . . .	222
<b>6</b>	<b>SEDs of disks</b>	<b>223</b>
6.1	Power-law disks . . . . .	223
6.2	Long-wavelength flux and disk mass . . . . .	224
6.3	Comparison with TTS observations: Heating mechanism . . . . .	226
6.3.1	Flared disks . . . . .	226
6.3.2	Heating by halos . . . . .	226
6.3.3	Disk atmospheres . . . . .	228
<b>7</b>	<b>Disk properties from observations</b>	<b>230</b>
7.1	Mass accretion rate . . . . .	230
7.2	Inner radius . . . . .	230
7.3	Masses . . . . .	231
7.4	Sizes . . . . .	231
<b>8</b>	<b>Disk lifetimes</b>	<b>233</b>
8.1	Ground-based near and mid-infrared surveys . . . . .	235
8.2	Mid-infrared ISOCAM surveys . . . . .	235
8.3	ISOPHOT 60 $\mu$ m survey . . . . .	236
8.4	Surveys at millimeter wavelengths . . . . .	236
<b>9</b>	<b>Disk evolution</b>	<b>238</b>
9.1	Can we observe the early planet formation phase? . . . . .	239
9.2	Evidence for grain growth . . . . .	239
9.3	Evidence of planetesimals . . . . .	241
9.4	Where is the disk mass? . . . . .	241
<b>10</b>	<b>Secondary or debris disks</b>	<b>242</b>
<b>11</b>	<b>Summary</b>	<b>245</b>

*Course 7. Dust in the Interstellar Medium*

*by F. Boulanger, P. Cox and A.P. Jones* 251

<b>1</b>	<b>Introduction</b>	<b>253</b>
<b>2</b>	<b>The phases of the interstellar medium</b>	<b>255</b>
<b>3</b>	<b>Abundances</b>	<b>256</b>
<b>4</b>	<b>Extinction curve</b>	<b>258</b>

<b>5</b>	<b>Infrared emission from dust</b>	<b>262</b>
5.1	Spectral energy distribution . . . . .	262
5.2	Grain temperatures and infrared emission . . . . .	263
<b>6</b>	<b>Dust composition as a function of size</b>	<b>270</b>
6.1	Interstellar PAHs . . . . .	270
6.1.1	Small aromatic hydrocarbons in cirrus . . . . .	271
6.1.2	Excitation by stellar light . . . . .	271
6.1.3	Carbon abundance in PAHs . . . . .	271
6.1.4	Band profiles . . . . .	275
6.2	Very small grains . . . . .	280
6.3	Large grains . . . . .	281
<b>7</b>	<b>Dust processing in the interstellar medium</b>	<b>282</b>
7.1	Grain sputtering and shattering in shock waves . . . . .	283
7.1.1	Physical processes . . . . .	283
7.1.2	Observations . . . . .	287
7.2	Grain growth in molecular clouds . . . . .	288
7.2.1	Physical processes . . . . .	288
7.2.2	Dust evolution in clouds . . . . .	292
7.2.3	Dust evolution in photo-dissociation regions . . . . .	294
<b>8</b>	<b>Dense media around protostars</b>	<b>296</b>
8.1	Absorption spectroscopy of embedded sources . . . . .	301
8.2	Dust around young stars . . . . .	308
<b>9</b>	<b>Dust formation</b>	<b>310</b>
9.1	AGB stars . . . . .	311
9.2	Physical processes . . . . .	311
9.3	Infrared spectroscopy of AGB and post-AGB stars . . . . .	315
9.3.1	Carbon-rich sources . . . . .	315
9.3.2	Oxygen-rich sources . . . . .	317
9.3.3	Evolved planetary nebulae . . . . .	321
9.4	Dust in SNR and hot stars . . . . .	322
<b>10</b>	<b>The life cycle of dust</b>	<b>323</b>
10.1	Sources of dust . . . . .	323
10.2	Dust processing in the interstellar medium . . . . .	324
10.3	The crystalline-amorphous-crystalline silicate transition . . . . .	325
10.4	Interstellar dust in the solar system . . . . .	326
<b>11</b>	<b>Summary and perspectives</b>	<b>327</b>

*Course 8. Normal Galaxies in the Infrared*

*by G. Helou* 337

<b>1</b>	<b>Introduction</b>	<b>339</b>
<b>2</b>	<b>The study of normal galaxies</b>	<b>341</b>
<b>3</b>	<b>Galaxies in the infrared: The IRAS ERA</b>	<b>343</b>
3.1	Basic parameters and statistics . . . . .	343
3.1.1	Infrared luminosity . . . . .	343
3.1.2	The infrared-to-blue ratio . . . . .	345
3.1.3	IRAS colors . . . . .	346
3.1.4	Other estimators . . . . .	347
3.2	Correlations . . . . .	348
3.3	The infrared-radio connection . . . . .	349
3.4	The “two-component model” . . . . .	352
<b>4</b>	<b>ISO reshapes the dust continuum</b>	<b>354</b>
4.1	ISO surveys of galaxies . . . . .	354
4.2	Mid-infrared spectra . . . . .	356
4.2.1	The aromatic features . . . . .	357
4.2.2	The mid-infrared continuum . . . . .	359
4.2.3	High-redshift applications . . . . .	360
4.2.4	Exceptions . . . . .	361
4.3	The ISO-IRAS color diagram . . . . .	362
4.3.1	The global infrared spectrum . . . . .	364
4.4	A mid-infrared look within galaxies . . . . .	364
<b>5</b>	<b>A walk in the line forest</b>	<b>367</b>
5.1	Molecular lines . . . . .	368
5.2	Fine-structure lines . . . . .	369
5.3	Interpreting the PDR lines . . . . .	371
<b>6</b>	<b>More studies</b>	<b>373</b>
<b>7</b>	<b>Tomorrow’s infrared galaxies</b>	<b>373</b>
7.1	Challenges and prospects . . . . .	373
7.2	Suggestions . . . . .	374
<b>8</b>	<b>Conclusion</b>	<b>375</b>

*Course 9. Active Galaxies*

*by D. Kunze* 381

<b>1</b>	<b>Introduction</b>	<b>383</b>
----------	---------------------	------------

<b>2</b>	<b>Starburst galaxies</b>	<b>384</b>
2.1	Scales of star formation: From H II regions to starburst galaxies	384
2.2	Observational properties of starburst galaxies	387
2.3	ISO observations of starburst galaxies	389
2.4	The galactic center	393
<b>3</b>	<b>Active galactic nuclei</b>	<b>395</b>
3.1	A unified model for AGNs	395
3.2	Massive central black holes	398
3.3	Observational properties of AGNs	399
3.4	ISO observations of AGNs	400
<b>4</b>	<b>Ultraluminous infrared galaxies</b>	<b>403</b>
4.1	ULIRGs as a class	403
4.2	Arp 220 – the Rosetta stone	408
4.3	The power source of ULIRGs	409

## *Course 10. Cosmology with ISO*

*by J.-L. Puget* 415

<b>1</b>	<b>Introduction</b>	<b>417</b>
<b>2</b>	<b>Relevant quantities and notations for number counts</b>	<b>419</b>
2.1	Number counts in the Euclidean case	419
2.2	Faint counts in the Friedman–Lemaître cosmology	420
2.3	Background radiation	423
<b>3</b>	<b>Spectra in the IR/SUBMM range</b>	<b>424</b>
3.1	Basic properties of dust absorption and emission	424
3.2	Infrared spectra of extragalactic sources	426
<b>4</b>	<b>Observations</b>	<b>428</b>
4.1	Deep surveys of weak sources	428
4.1.1	ISOCAM deep surveys of distant galaxies	428
4.1.2	ISOPHOT deep surveys of distant galaxies	429
4.1.3	Deep cosmological surveys with SCUBA	430
4.2	Observations of the Cosmic Background	431
4.2.1	Relevant foreground observations	432
4.2.2	The cosmic infrared background at sub-millimeter wavelengths	433
4.2.3	The cosmic background at all wavelengths	434
4.2.4	ISO observations of the background anisotropies	435

<b>5</b>	<b>Cosmological implications</b>	<b>436</b>
5.1	Where is the nucleosynthesis energy? . . . . .	436
5.2	Starburst galaxies <i>vs.</i> AGNs . . . . .	437
5.3	Star formation at high redshift . . . . .	439
<b>6</b>	<b>Models of galaxy in the infrared</b>	<b>442</b>
6.1	Spectral energy distributions . . . . .	442
6.2	Phenomenological models . . . . .	443
6.3	Semi-analytic models . . . . .	443
<b>7</b>	<b>Future cosmological observations in the infrared</b>	<b>444</b>
<b>8</b>	<b>Conclusions</b>	<b>446</b>
	<i>Seminars by participants</i>	<i>451</i>

Astronomie spatiale infrarouge, aujourd'hui et demain

Infrared space astronomy, today and tomorrow

3-28 August 1998

Casoli, F.; Lequeux, J.; David, F. (Eds.)

2000, XXXIV, 454 p. 175 illus., Hardcover

ISBN: 978-3-540-67386-6
