## Introductory considerations

---

<b>The misery of constitutive modelling .....</b>	<b>11</b>
---	-----------

*D. KOLYMBAS*

1 Introduction .....	11
2 Meaning of material constants .....	12
3 A review of the present situation in constitutive modelling .....	13
4 Validation of constitutive models .....	15
5 On the physical foundation of constitutive models .....	15
6 Requirements on constitutive models .....	16
7 How simple should a model be? .....	19
8 Numerical implementations .....	20
9 Cooperation .....	22
10 The future of research .....	23
References .....	23

<b>Does engineering need science? .....</b>	<b>25</b>
---	-----------

*C. VIGGIANI*

1 Foreword .....	25
2 Definition of engineering .....	25
3 Definition of science .....	25
4 Relations between engineering and sciences .....	27
5 Some examples .....	31
6 The forthcoming Middle Ages? .....	33
References .....	35

<b>The role of models in civil engineering .....</b>	<b>37</b>
--	-----------

*D. MUIR WOOD*

1 Introduction .....	37
2 Models .....	38
3 Children's models .....	39
4 Students' models .....	42
5 Engineers' models .....	46
6 Philosophers' models .....	50
7 Conclusion .....	52
References .....	55

---

**Overview of hypoplasticity**

---

<b>Hypoplasticity then and now</b> .....	57
<i>W. WU, D. KOLYMBAS</i>	
1 Introduction .....	57
2 A heuristic example .....	58
3 Some historical remarks .....	61
4 Framework of hypoplasticity .....	65
5 Response envelope: a useful tool .....	72
6 Extensions: a tale of two terms .....	82
7 Simple boundary value problem .....	92
8 Miscellaneous .....	96
9 Concluding remarks .....	99
References .....	101
<b>A review of two different approaches to hypoplasticity</b> .....	107
<i>C. TAMAGNINI, G. VIGGIANI, R. CHAMBON</i>	
1 Introduction .....	107
2 Mathematical structure .....	109
3 Invertibility, consistency and limit states .....	118
4 Strain localization and bifurcation analysis .....	126
5 Conclusions .....	137
References .....	138
A Gudehus/Bauer K-hypoplastic model .....	144
B von Wolffersdorff K-hypoplastic model .....	144
<b>Uniqueness, second order work and bifurcation in hypoplasticity</b>	147
<i>R. CHAMBON</i>	
1 Introduction .....	147
2 Existence and uniqueness of boundary value problems involving hypoplastic constitutive equations .....	148
3 Rice analysis with hypoplastic constitutive equations .....	155
4 Invertibility and controllability seen as boundary value problems ...	161
5 Conclusion .....	163
References .....	164
<b>Stationary states in hypoplasticity</b> .....	167
<i>E. BAUER, I. HERLE</i>	
1 Introduction .....	167
2 Historical development of hypoplastic models of the Kolymbas type	169
3 Stationary states and modeling of the critical stress state surface ...	179
4 Determination of the material parameters .....	183
5 Extension to a polar continuum .....	185
Acknowledgements .....	188
References .....	189

---

**Generalized continua and microscopic approach**

---

**Microscopic approach contributions to constitutive modelling . 193**
*C. THORNTON*

1	Introduction . . . . .	193
2	Macroscopic ensemble behaviour . . . . .	194
3	Induced structural anisotropy . . . . .	194
4	Physics at the grain scale . . . . .	198
5	Conclusions . . . . .	207
6	Acknowledgements . . . . .	207
	References . . . . .	207

**Discrete and continuum modelling of granular materials . . . . . 209**
*H.-B. MÜHLHAUS, L. MORESI, H. SAKAGUCHI*

1	Introduction . . . . .	209
2	Formulation . . . . .	211
3	Lagrangian Particle Method . . . . .	217
4	Examples . . . . .	220
5	Concluding Remarks . . . . .	223
	References . . . . .	224

**2<sup>nd</sup> Gradient constitutive models . . . . . 225**
*I. VARDOULAKIS*

1	The continuum assumption . . . . .	225
2	Averaging and the meaning of 2 <sup>nd</sup> gradients . . . . .	226
3	A simple 2 <sup>nd</sup> gradient structural model . . . . .	229
4	A Mindlin-type 2 <sup>nd</sup> gradient linear elasticity . . . . .	231
5	A 2 <sup>nd</sup> gradient plasticity model for granular materials . . . . .	239
6	Acknowledgments . . . . .	247
	References . . . . .	247

**Micro-mechanically based higher-order continuum models for granular materials . . . . . 249**
*A.S.J. SUIKER, R. de BORST, C.S. CHANG*

1	Introduction . . . . .	249
2	Micro-level particle interaction . . . . .	250
3	From micro-level to macro-level . . . . .	254
4	Macroscopic constitutive formulation . . . . .	256
5	Continuum models versus discrete lattice model . . . . .	259
6	Higher-order continuum model that includes particle rotation . . . . .	266
7	Conclusions . . . . .	272
	References . . . . .	272

**Relevant local variables for the change of scale in granular materials..... 275**

*B. CAMBOU, F. DEDECKER, M. CHAZE*

1	Introduction.....	275
2	Definition of the material and considered scales .....	275
3	Analysis of the change of scale when the local level is defined at the contact between particles .....	278
4	Analysis of the change of scale when the local level is defined for a local array of particles .....	285
5	Conclusion .....	287
	References .....	289

---

**Physical aspects**

---

**On the physical background of soil strength ..... 291**

*G. GUDEHUS*

1	Introduction.....	291
2	Steady states .....	292
3	Dilatant soils .....	294
4	Contractant soils.....	298
5	Miscellaneous.....	299
	References .....	300

**The influence of time derivative terms on the mechanical behaviour of loose sands ..... 303**

*C. di PRISCO, S. IMPOSIMATO*

1	Introduction.....	303
2	Experimental observations .....	304
3	Mathematical Modelling .....	308
4	Concluding remarks .....	315
5	Acknowledgements .....	317
	References .....	317
	Appendix A .....	318

**An approach to plasticity based on generalised thermodynamics..... 319**

*G.T. HOULSBY, A.M. PUZRIN*

1	Introduction.....	319
2	Thermomechanical formulation .....	320
3	Computational Examples .....	326
4	Classification of plasticity models .....	329
5	Conclusions .....	330
6	Acknowledgment.....	331
	References .....	331

---

**Comparison of different approaches**

---

**Comparison of hypoplastic and elastoplastic modelling of undrained triaxial tests on loose sand** ..... 333

*I. HERLE, T. DOANH, W. WU*

1	Introduction	333
2	Experimental observations	333
3	Constitutive models	337
4	Comparison of experiments with calculations	338
5	Instability surface	342
6	Modification of the hypoplastic model	344
7	Conclusions	348
	Acknowledgement	349
	References	349

**Hypoplastic and elastoplastic modelling – a comparison with test data** ..... 353

*Th. MARCHER, P.A. VERMEER, P.-A. von WOLFFERSDORFF*

1	Introduction	353
2	Experimental data	354
3	Hypoplastic calculation	355
4	Elastoplastic calculations	360
5	Comparison	365
6	Conclusions	370
7	Acknowledgements	371
	References	371

**Strain response envelope: a complementary tool for evaluating hypoplastic constitutive equations** ..... 375

*T. DOANH*

1	Introduction	375
2	Experimental observations	376
3	Hypoplastic analysis	380
4	Predictive capability of hypoplasticity	390
5	Conclusions	394
	References	394

---

**Special models**

---

**Modelling weathering effects on the mechanical behaviour of granite** ..... 397

*R. NOVA*

1	Introduction	397
2	Conceptual model for weathering effects on rock behaviour	398

3	An application to the weathering of granite .....	401
4	Conclusions .....	409
	Reference .....	411

### **A plasticity-based constitutive model for natural soils: a hierarchical approach .....**

<b>A. AMOROSI, M. J. KAVVADAS</b>		
1	Introduction .....	413
2	Some aspects of the mechanical behaviour of natural soils .....	414
3	The proposed model .....	420
4	Conclusions .....	436
	References .....	436

### **Experimental bases for a new incremental non-linear constitutive relation with 5 parameters .....**

<b>F. DARVE, X. ROGUIEZ</b>		
1	Introduction .....	439
2	Non linear incremental formalism .....	439
3	Generalized triaxial apparatus .....	441
4	Sand characteristics .....	442
5	Initial Experiments .....	443
6	Analysis of the tangent characteristics of a curve .....	445
7	Classical oedometric test .....	445
8	Oedometric test of class $C_2$ .....	450
9	Oedometric test of class $C_3$ .....	453
10	Conclusion .....	454
11	Acknowledgements .....	455
	References .....	456

---

## **Numerical applications**

---

### **Implicit integration of hypoplastic models .....**

<b>O. M. HEERES, R. de BORST</b>		
1	Introduction .....	457
2	Introduction to hypoplasticity .....	458
3	A hypoplastic model for granular materials with a predefined limit state .....	463
4	Finite element simulations of the direct shear box test .....	466
5	Concluding remarks .....	469
	References .....	470

### **Soil-water coupling analysis of progressive failure in cuts with a strain softening model .....**

<b>T. ADACHI, F. OKA, H. OSAKI, F. ZHANG</b>		
1	Introduction .....	471

2	Elasto-plastic model with strain softening .....	472
3	Finite element analysis of progressive failure in cuts of ideal model ground .....	475
4	Conclusions .....	487
	References .....	490
	<b>Advances in modelling soil anisotropy .....</b>	<b>491</b>
	<i>L. ZDRAVKOVIC, D.M. POTTS</i>	
1	Introduction .....	491
2	Experiments on silt .....	492
3	Modelling anisotropic soil behaviour .....	497
4	Examples .....	498
5	Conclusions .....	513
	Appendix .....	515
	References .....	519
	<b>Examples of finite element calculations with the hypoplastic law .....</b>	<b>523</b>
	<i>K. NÜBEL, R. CUDMANI</i>	
1	Settlement of earth embankment on a landfill material .....	523
2	Cyclic twisting of a tube in sand .....	528
	References .....	538
	<b>Hypoplastic simulation of complex loading paths .....</b>	<b>539</b>
	<i>S. V. LAVRIKOV, A. Ph. REVUZHENKO</i>	
1	Introduction .....	539
2	Realization of experiments .....	540
3	Hypoplastic homogeneous simulation .....	542
4	Numerical results .....	545
5	Hypoplastic simulation of the boundary value problem .....	548
6	Incremental solution .....	550
7	Calculation of results .....	551
	References .....	553
