

CONTENTS

COURSE 1

Dynamics and Transport Properties of Aperiodic Crystals

by T. Janssen

1. Structure and symmetry	1
2. Phonons.....	5
3. Domain wall motion.....	11
4. Electrons	13
5. Tensorial properties	16
6. Surface effects	17
7. Transport properties	19
8. Concluding remarks	20

COURSE 2

Diffraction Experiments on Quasicrystals and Related Phases

by F. Dénoyer

1. Introduction	23
2. Decagonal quasicrystals	24
2.1 Generalities	24
2.2 X-ray structure determination of decagonal quasicrystals	24
3. Decagonal symmetry and twinning.....	30
3.1 Tenfold twinning of $Al_{13}Fe_4$ and $Al_{13}Fe_4$ -type structure	30
3.2 Twinning in the structure of decagonal phases and fine structure of diffraction peaks	32
3.3 Twinning and main characteristic features of diffraction patterns ..	32
3.4 Description of microstructures in terms of phason-strain quasicrystals	35

4. Quasicrystal transformations	41
5. Icosahedral short range order in glasses.....	42
6. Conclusion.....	45

COURSE 3

Electronic Properties of Quasicrystals. A Comparison with Approximant Phases and Disordered Systems

given by C. Berger

written by C. Berger and T. Grenet

1. Introduction	49
1.1 Quasiperiodic order	50
1.2 Quasicrystals, crystals and amorphous phases.....	52
1.3 Samples of high structural quality in ternary alloys	53
1.4 Unexpected physical properties	54
2. Conductivity and density of states in quasicrystals	54
2.1 Low electrical conductivity values in <i>i</i> -phases	54
2.2 Low electronic density of states in quasicrystals	57
3. Comparison with other metallic alloys	59
3.1 Scale of conductivity in metallic alloys.....	59
3.2 Effect of diffraction	60
3.3 Quantum interference effects in disordered systems	61
3.4 Disordered insulator and Anderson localization	65
4. Periodicity as an approach to quasiperiodicity	65
4.1 Approximant phases	66
4.2 Experimental electrical conductivity in approximant phases	66
4.3 Calculated electronic properties in approximants	68
4.4 Low dimensional perfect quasiperiodic models.....	69
5. Quasicrystals as ordered structures of high symmetry	72
5.1 Pseudo Brillouin zone	72
5.2 Role of local atomic clusters	74
6. Towards a metal-insulator transition in quasicrystals: Comparison with disordered systems	75

6.1	Some experimental evidence for the approach to a metal-insulator transition in quasicrystals.....	76
6.2	Crossing of the metal-insulator transition in i -AlPdRe	77
7.	Conclusion.....	79

COURSE 4

Exact Electron States in 1D (Quasi-) Periodic Arrays of Delta-Potentials

given by P. Kramer

written by P. Kramer and T. Kramer

1.	Introduction and scope.....	85
2.	Finite periodic strings at negative energy	89
2.1	Preview: An energy gauge for crystals	89
2.2	Bloch and bound states in a single band.....	90
2.3	The string S^n	95
2.4	Rational Bloch labels	96
2.5	Bound states and clusters of the string S^n	96
2.6	Participation number.....	98
2.7	Supercell interpretation	99
2.8	Large n limit.....	99
3.	Finite quasiperiodic strings at negative energy.....	100
3.1	Preview: Energy gauge in Fibonacci strings	100
3.2	Substitutional systems and their invariants	101
3.3	Recursive calculation of the transfer matrix.....	102
4.	Periodic strings at positive energy	106
4.1	The S -matrix.....	107
4.2	The S -matrix for the periodic string S^n	108
5.	Quasiperiodic strings at positive energy	110
5.1	The Fibonacci-atlas	110
6	Conclusion.....	112

COURSE 5**Random Tiling Models for Quasicrystals**

by E. Cockayne

1. Introduction	115
1.1 Basic definitions	116
1.2 Generation of quasicrystalline tilings	117
1.3 Randomization of tilings	120
1.4 A zoo of tiling models	121
2. Mathematics of random tilings	123
2.1 Entropy density and phason elastic constants	123
2.2 Long-wavelength behavior and stability	126
2.3 Diffraction	127
3. Random tiling results	128
3.1 Monte Carlo simulation	128
3.2 Combinatorics	129
3.3 Transfer matrix method	130
3.4 Bethe Ansatz method	132
4. Atomic models for quasicrystals	132
4.1 HREM/diffraction-based	133
4.2 Models based on realistic interatomic forces	136
4.3 Other models	138
5. Quasicrystal phase transformations	139
5.1 Phason unlocking	139
5.2 Quasicrystal \leftrightarrow (micro)crystal	139
6. Conclusions	140

COURSE 6**Model Sets: A Survey**

by R.V. Moody

1. Introduction	145
2. Model sets	147
3. Geometric side	149
4. Arithmetic side	150

4.1 The icosian model sets	150
4.2 p -adic model sets	152
5. Analytic side	155
6. Dynamical systems side	157
7. Diffraction	160
7.1 Comments	163

COURSE 7

Acceptance Windows Compatible with a Quasicrystal Fragment

given by J. Patera

written by Z. Masáková, J. Patera and E. Pelantová

1. Introduction	167
2. Notation and auxiliary facts	171
3. Local invariance and the forward growth	174
4. The maximal acceptance window	178
5. Example: Analysis of two-dimensional quasicrystal data.....	180
6. Comments and remarks	189

COURSE 8

Counting Systems with Irrational Basis for Quasicrystals

given by J.P. Gazeau

written by J.P. Gazeau and R. Krejcar

1. Introduction	195
2. The set of τ -integers	197
3. Tau-integer labelling of the Fibonacci chain.....	199
4. Tau-integer labelling of diffraction pattern.....	202
5. Tau-integer labelling of two-dimensional structures	205
6. Arithmetics and algebra of the β -integers	211

COURSE 9**Acoustic-Like Excitations in Strongly Disordered Media**

given by E. Courtens

written by E. Courtens and R. Vacher

1. Introduction	219
2. The case of mass-fractal media	221
2.1 The structure of mass fractals	222
2.2 The concept of mutually self-similar series of MSSS	226
2.3 The dynamics of mass fractals	227
3. The case of glasses	234
3.1 What is already established	236
3.2 Spectroscopy of acoustic excitations in the terahertz regime – three remarks	240
3.3 Some studies near the end of acoustic branches in glasses	243
4. Conclusions	249

COURSE 10**Intermittent Dynamics and Ageing in Glassy Systems**

by J.-Ph. Bouchaud

1. Introduction	261
2. A simple model: Traps and intermittent dynamics	263
3. Relation with mode-coupling descriptions	265
4. Self-induced quenched disorder and open questions	267

COURSE 11**A Short Introduction to Ergodic Theory
and Its Applications**

by F.M. Dekking

1. Dynamical systems	273
1.1 Examples	273
1.2 Recurrence	277
1.3 Ergodic theorem	278

1.4 Unique ergodicity	280
1.5 Expected recurrence time	281
2. Spectral properties of dynamical systems	282
2.1 The spectrum of a dynamical system	282
2.2 Mixing	283
3. Entropy of dynamical systems	284
3.1 Isomorphism	286
3.2 Entropy and Hausdorff dimension	287
4. Epilogue	288

COURSE 12

Fractality and the Kinetics of Chaos

by G.M. Zaslavsky

1. Introduction	291
2. Mapping the dynamics	295
3. Topological zoo (singular zones)	297
4. Self-similar hierarchy of islands	300
5. Quasi-traps	301
6. Boundary layer as a quasi-trap	303
7. Fractal and multifractal space-time of kinetics	304
8. Dimension spectrum of the multifractal space-time	307
9. Fractional kinetics	309
10. Conclusions	312

COURSE 13

Long-Tailed Distributions in Physics

given by M.F. Shlesinger

written by M.F. Shlesinger, J. Klafter and G. Zumofen

1. Introduction	315
2. Fractal time	319
3. Slow relaxations	321
4. Fractal space processes	321
5. Nonlinear dynamics	324

COURSE 14

Distribution of Galaxies: Scaling vs. Fractality

by R. Balian

1. Introduction	329
2. Algebra of point distributions	330
2.1 Densities and correlations	330
2.2 Counts in cells	332
3. Scale invariance	333
3.1 Scaling of correlations	333
3.2 The void probability	333
3.3 Scaling of counts in cells	334
4. Fractality	336
4.1 Correlation dimension	336
4.2 Hausdorff dimension for occupied cells	337
4.3 Renyi index	338
4.4 Multifractal dimension	340
5. Conclusion	343

From Quasicrystals to More Complex Systems

Les Houches School, February 23 - March 6, 1998

Axel, F.; Denoyer, F.; Gazeau, J.P. (Eds.)

2000, XX, 375 p. 67 illus., Softcover

ISBN: 978-3-540-67464-1
