## *Course 1. The Century of Turbulence Theory: The Main Achievements and Unsolved Problems*

*by A. Yaglom* 1

<b>1 Introduction</b>	<b>3</b>
<b>2 Flow instability and transition to turbulence</b>	<b>6</b>
<b>3 Development of the theory of turbulence in the 20th century: Exemplary achievements</b>	<b>11</b>
3.1 Similarity laws of near-wall turbulent flows . . . . .	11
3.2 Kolmogorov's theory of locally isotropic turbulence . . . . .	30
<b>4 Concluding remarks; possible role of Navier–Stokes equations</b>	<b>39</b>

## *Course 2. Measures of Anisotropy and the Universal Properties of Turbulence*

*by S. Kurien and K.R. Sreenivasan* 53

<b>1 Introduction</b>	<b>56</b>
<b>2 Theoretical tools</b>	<b>58</b>
2.1 The method of $SO(3)$ decomposition . . . . .	58
2.2 Foliation of the structure function into $j$ -sectors . . . . .	62
2.3 The velocity structure functions . . . . .	63
2.3.1 The second-order structure function . . . . .	64

2.4	Dimensional estimates for the lowest-order anisotropic scaling exponents . . . . .	66
2.5	Summary . . . . .	68
<b>3</b>	<b>Some experimental considerations</b>	<b>69</b>
3.1	Background . . . . .	69
3.2	Relevance of the anisotropic contributions . . . . .	69
3.3	The measurements . . . . .	70
<b>4</b>	<b>Anisotropic contribution in the case of homogeneity</b>	<b>74</b>
4.1	General remarks on the data . . . . .	74
4.2	The tensor form for the second-order structure function . . . . .	76
4.2.1	The anisotropic tensor component derived under the assumption of axisymmetry . . . . .	76
4.2.2	The complete $j = 2$ anisotropic contribution . . . . .	81
4.3	Summary . . . . .	85
<b>5</b>	<b>Anisotropic contribution in the case of inhomogeneity</b>	<b>85</b>
5.1	Extracting the $j = 1$ component . . . . .	85
<b>6</b>	<b>The higher-order structure functions</b>	<b>88</b>
6.1	Introduction . . . . .	88
6.2	Method and results . . . . .	89
6.2.1	The second-order structure function . . . . .	89
6.2.2	Higher-order structure functions . . . . .	92
6.3	Summary . . . . .	93
<b>7</b>	<b>Conclusions</b>	<b>98</b>
<b>Appendix</b>		<b>99</b>
<b>A</b>	<b>Full form for the <math>j = 2</math> contribution for the homogeneous case</b>	<b>99</b>
<b>B</b>	<b>The <math>j = 1</math> component in the inhomogeneous case</b>	<b>105</b>
B.1	Antisymmetric contribution . . . . .	105
B.2	Symmetric contribution . . . . .	107
<b>C</b>	<b>Tests of the robustness of the interpolation formula</b>	<b>109</b>
 <i>Course 3. Large-Eddy Simulations of Turbulence</i>		
<i>by O. Métais</i>		<i>113</i>
<b>1</b>	<b>Introduction</b>	<b>117</b>
1.1	LES and determinism: Unpredictability growth . . . . .	118

<b>2</b>	<b>Vortex dynamics</b>	<b>119</b>
2.1	Coherent vortices . . . . .	120
2.1.1	Definition . . . . .	120
2.1.2	Pressure . . . . .	120
2.1.3	The $Q$ -criterion . . . . .	120
2.2	Vortex identification . . . . .	121
2.2.1	Isotropic turbulence . . . . .	122
2.2.2	Backward-facing step . . . . .	123
<b>3</b>	<b>LES formalism in physical space</b>	<b>125</b>
3.1	LES equations for a flow of constant density . . . . .	125
3.2	LES Boussinesq equations in a rotating frame . . . . .	128
3.3	Eddy-viscosity and diffusivity assumption . . . . .	128
3.4	Smagorinsky's model . . . . .	130
<b>4</b>	<b>LES in Fourier space</b>	<b>131</b>
4.1	Spectral eddy viscosity and diffusivity . . . . .	131
4.2	EDQNM plateau-peak model . . . . .	132
4.2.1	The spectral-dynamic model . . . . .	134
4.2.2	Existence of the plateau-peak . . . . .	135
4.3	Incompressible plane channel . . . . .	137
4.3.1	Wall units . . . . .	138
4.3.2	Streaks and hairpins . . . . .	138
4.3.3	Spectral DNS and LES . . . . .	139
<b>5</b>	<b>Improved models for LES</b>	<b>143</b>
5.1	Structure-function model . . . . .	143
5.1.1	Formalism . . . . .	143
5.1.2	Non-uniform grids . . . . .	145
5.1.3	Structure-function <i>versus</i> Smagorinsky models . . . . .	145
5.1.4	Isotropic turbulence . . . . .	146
5.1.5	SF model, transition and wall flows . . . . .	146
5.2	Selective structure-function model . . . . .	146
5.3	Filtered structure-function model . . . . .	147
5.3.1	Formalism . . . . .	147
5.4	A test case for the models: The temporal mixing layer . . . . .	147
5.5	Spatially growing mixing layer . . . . .	149
5.6	Vortex control in a round jet . . . . .	151
5.7	LES of spatially developing boundary layers . . . . .	153
<b>6</b>	<b>Dynamic approach in physical space</b>	<b>158</b>
6.1	Dynamic models . . . . .	158

<b>7</b>	<b>Alternative models</b>	<b>161</b>
7.1	Generalized hyperviscosities . . . . .	161
7.2	Hyperviscosity . . . . .	162
7.3	Scale-similarity and mixed models . . . . .	162
7.4	Anisotropic subgrid-scale models . . . . .	163
<b>8</b>	<b>LES of rotating flows</b>	<b>163</b>
8.1	Rotating shear flows . . . . .	164
8.1.1	Free-shear flows . . . . .	164
8.1.2	Wall flows . . . . .	165
8.1.3	Homogeneous turbulence . . . . .	169
<b>9</b>	<b>LES of flows of geophysical interest</b>	<b>169</b>
9.1	Baroclinic eddies . . . . .	169
9.1.1	Synoptic-scale instability . . . . .	171
9.1.2	Secondary cyclogenesis . . . . .	172
<b>10</b>	<b>LES of compressible turbulence</b>	<b>173</b>
10.1	Compressible LES equations . . . . .	174
10.2	Heated flows . . . . .	175
10.2.1	The heated duct . . . . .	176
10.2.2	Towards complex flow geometries . . . . .	177
<b>11</b>	<b>Conclusion</b>	<b>181</b>

*Course 4. Statistical Turbulence Modelling for the Computation of Physically Complex Flows*

*by M.A. Leschziner* 187

<b>1</b>	<b>Approaches to characterising turbulence</b>	<b>189</b>
<b>2</b>	<b>Some basic statistical properties of turbulence and associated implications</b>	<b>196</b>
<b>3</b>	<b>Review of “simple” modelling approaches</b>	<b>203</b>
3.1	The eddy-viscosity concept . . . . .	203
3.2	Model categories . . . . .	204
3.3	Model applicability . . . . .	207
<b>4</b>	<b>Second-moment equations and implied stress-strain interactions</b>	<b>212</b>
4.1	Near-wall shear . . . . .	215
4.2	Streamline curvature . . . . .	217
4.3	Separation and recirculating flow . . . . .	218
4.4	Rotation . . . . .	219

4.5	Irrotational strain . . . . .	220
4.6	Heat transfer and stratification . . . . .	221
<b>5</b>	<b>Second moment closure</b>	<b>222</b>
<b>6</b>	<b>Non-linear eddy-viscosity models</b>	<b>228</b>
<b>7</b>	<b>Application examples</b>	<b>233</b>
7.1	Overview . . . . .	233
7.2	Asymmetric diffuser . . . . .	235
7.3	Aerospatale aerofoil . . . . .	235
7.4	Cascade blade . . . . .	238
7.5	Axisymmetric impinging jet . . . . .	239
7.6	Prolate spheroid . . . . .	240
7.7	Round-to-rectangular transition duct . . . . .	242
7.8	Wing/flat-plate junction . . . . .	245
7.9	Fin-plate junction . . . . .	246
7.10	Jet-afterbody combination . . . . .	251
<b>8</b>	<b>Concluding remarks</b>	<b>251</b>

## *Course 5. Computational Aeroacoustics*

*by R. Mankbadi* 259

<b>1</b>	<b>Fundamentals of sound transmission</b>	<b>261</b>
1.1	One-dimensional wave analysis . . . . .	262
1.1.1	General solution of the wave equation . . . . .	263
1.1.2	The particle velocity . . . . .	263
1.2	Three-dimensional sound waves . . . . .	264
1.3	Sound spectra . . . . .	265
1.3.1	Spectral composition of a square pulse . . . . .	266
1.3.2	Spectral composition of a harmonic signal . . . . .	266
1.4	Logarithmic scales for rating noise . . . . .	266
1.4.1	The Sound Power Level (PWL) . . . . .	266
1.4.2	Sound Pressure Levels (SPL) . . . . .	267
1.4.3	Pressure Band Level (PBL) . . . . .	267
1.4.4	Pressure Spectral Level (PSL) per unit frequency . . . . .	267
1.4.5	Acoustic intensity . . . . .	269
1.4.6	Overall pressure levels . . . . .	269
1.4.7	Subjective noise measures . . . . .	269
1.4.8	Perceived Noise Level (PNL) . . . . .	270
1.4.9	Tone Corrected Perceived Noise Level (PNLT) . . . . .	270
1.4.10	Effective Perceived Noise Level (EPNL) . . . . .	270

<b>2</b>	<b>Aircraft noise sources</b>	<b>271</b>
2.1	Noise regulations . . . . .	271
2.2	Contribution from various components . . . . .	271
2.3	Engine noise . . . . .	271
2.3.1	Elements of the generation process . . . . .	272
2.3.2	Noise measurements . . . . .	272
<b>3</b>	<b>Methodology for jet noise</b>	<b>278</b>
3.1	Jet noise physics . . . . .	278
3.2	CAA for jet noise . . . . .	279
3.3	Wave-like sound source . . . . .	281
3.4	Lighthill's theory . . . . .	285
3.4.1	Application of Lighthill's theory . . . . .	287
3.5	Kirckhoff's solution . . . . .	288
<b>4</b>	<b>Algorithms and boundary treatment</b>	<b>290</b>
4.1	Algorithms for CAA . . . . .	290
4.1.1	The 2-4 scheme . . . . .	292
4.1.2	The compact scheme . . . . .	292
4.1.3	The Dispersion-Relation-Preserving scheme . . . . .	293
4.2	Boundary treatment for CAA . . . . .	293
4.2.1	Wall boundary conditions . . . . .	295
4.2.2	Outflow boundary treatment . . . . .	295
4.2.3	Radiation boundary condition . . . . .	295
4.2.4	Inflow treatments . . . . .	296
<b>5</b>	<b>Large-eddy simulations and linearized Euler</b>	<b>298</b>
5.1	Large-eddy simulation . . . . .	298
5.1.1	Filtering . . . . .	300
5.1.2	Filtered equations . . . . .	301
5.1.3	Modelling subgrid-scale turbulence . . . . .	304
5.2	Linearized Euler equations . . . . .	308

*Course 6. The Topology of Turbulence*  
*by H.K. Moffatt* 319

<b>1</b>	<b>Introduction</b>	<b>321</b>
<b>2</b>	<b>The family of helicity invariants</b>	<b>322</b>
2.1	Chaotic fields . . . . .	323
2.2	Simply degenerate fields . . . . .	324
2.3	Doubly degenerate fields . . . . .	324
<b>3</b>	<b>The special case of Euler dynamics</b>	<b>325</b>

<b>4</b>	<b>Scalar field structure in 2D flows</b>	<b>326</b>
<b>5</b>	<b>Scalar field structure in 3D flows</b>	<b>327</b>
<b>6</b>	<b>Vector field structure in 3D flows</b>	<b>328</b>
<b>7</b>	<b>Helicity and the turbulent dynamo</b>	<b>329</b>
7.1	The kinematic phase . . . . .	330
7.2	The dynamic phase . . . . .	333
<b>8</b>	<b>Magnetic relaxation</b>	<b>334</b>
8.1	The analogy with Euler flows . . . . .	335
<b>9</b>	<b>The blow-up problem</b>	<b>336</b>
9.1	Interaction of skewed vortices . . . . .	337

## *Course 7. “Burgulence”*

*by U. Frisch and J. Bec* **341**

<b>1</b>	<b>Introduction</b>	<b>343</b>
1.1	The Burgers equation in cosmology . . . . .	344
1.2	The Burgers equation in condensed matter and statistical physics .	347
1.3	The Burgers equation as testing ground for Navier–Stokes . . . . .	347
<b>2</b>	<b>Basic tools</b>	<b>348</b>
2.1	The Hopf–Cole transformation and the maximum representation .	348
2.2	Shocks in one dimension . . . . .	350
2.3	Convex hull construction in more than one dimension . . . . .	354
2.4	Remarks on numerical methods . . . . .	355
<b>3</b>	<b>The Fourier–Lagrange representation and artefacts</b>	<b>356</b>
<b>4</b>	<b>The law of energy decay</b>	<b>358</b>
<b>5</b>	<b>One-dimensional case with Brownian initial velocity</b>	<b>363</b>
<b>6</b>	<b>Preshocks and the pdf of velocity gradients in one dimension</b>	<b>367</b>
<b>7</b>	<b>The pdf of density</b>	<b>370</b>
<b>8</b>	<b>Kicked burgulence</b>	<b>373</b>
8.1	Forced Burgers equation and variational formulation . . . . .	373

8.2	Periodic kicks . . . . .	376
8.3	Connections with Aubry–Mather theory . . . . .	380

## *Course 8. Two-Dimensional Turbulence*

*by J. Sommeria* 385

<b>1</b>	<b>Introduction</b>	<b>387</b>
<b>2</b>	<b>Equations and conservation laws</b>	<b>391</b>
2.1	Euler vs. Navier–Stokes equations . . . . .	391
2.2	Vorticity representation . . . . .	392
2.3	Conservation laws . . . . .	393
2.4	Steady solutions of the Euler equations . . . . .	396
<b>3</b>	<b>Vortex dynamics</b>	<b>397</b>
3.1	Systems of discrete vortices . . . . .	398
3.2	Vortex pairs . . . . .	399
3.3	Instability of shear flows and vortex lattices . . . . .	403
3.4	Statistical mechanics of point vortices . . . . .	404
<b>4</b>	<b>Spectral properties, energy and enstrophy cascade</b>	<b>411</b>
4.1	Spectrally truncated equilibrium states . . . . .	412
4.2	The enstrophy and inverse energy cascades of forced turbulence . . . . .	415
4.3	The enstrophy cascade of freely evolving turbulence . . . . .	422
4.4	The emergence and evolution of isolated vortices . . . . .	423
<b>5</b>	<b>Equilibrium statistical mechanics and self-organization</b>	<b>425</b>
5.1	Statistical mechanics of non-singular vorticity fields . . . . .	425
5.2	The Gibbs states . . . . .	428
5.3	Tests and discussion . . . . .	432
<b>6</b>	<b>Eddy diffusivity and sub-grid scale modeling</b>	<b>435</b>
6.1	Thermodynamic approach . . . . .	435
6.2	Kinetic models . . . . .	439
<b>7</b>	<b>Conclusions</b>	<b>442</b>

## *Course 9. Analysing and Computing Turbulent Flows Using Wavelets*

*by M. Farge and K. Schneider* 449

<b>1</b>	<b>Introduction</b>	<b>453</b>
----------	---------------------	------------

<b>I</b>	<b>Wavelet Transforms</b>	<b>456</b>
<b>2</b>	<b>History</b>	<b>456</b>
<b>3</b>	<b>The continuous wavelet transform</b>	<b>457</b>
3.1	One dimension . . . . .	457
3.1.1	Analyzing wavelet . . . . .	457
3.1.2	Wavelet analysis . . . . .	458
3.1.3	Wavelet synthesis . . . . .	459
3.1.4	Energy conservation . . . . .	459
3.2	Higher dimensions . . . . .	459
3.3	Algorithm . . . . .	460
<b>4</b>	<b>The orthogonal wavelet transform</b>	<b>461</b>
4.1	One dimension . . . . .	461
4.1.1	1D Multi-Resolution Analysis . . . . .	461
4.1.2	Regularity and local decay of wavelet coefficients . . . . .	463
4.2	Higher dimensions . . . . .	463
4.2.1	Tensor product construction . . . . .	463
4.2.2	2D Multi-Resolution Analysis . . . . .	464
4.2.3	Periodic 2D Multi-Resolution Analysis . . . . .	465
4.3	Algorithm . . . . .	466
<b>II</b>	<b>Statistical Analysis</b>	<b>468</b>
<b>5</b>	<b>Classical tools</b>	<b>468</b>
5.1	Methodology . . . . .	468
5.1.1	Laboratory experiments . . . . .	468
5.1.2	Numerical experiments . . . . .	468
5.2	Averaging procedure . . . . .	469
5.3	Statistical diagnostics . . . . .	470
5.3.1	Probability Distribution Function (PDF) . . . . .	470
5.3.2	Radon–Nikodyn’s theorem . . . . .	471
5.3.3	Definition of the joint probability . . . . .	471
5.3.4	Statistical moments . . . . .	471
5.3.5	Structure functions . . . . .	472
5.3.6	Autocorrelation function . . . . .	472
5.3.7	Fourier spectrum . . . . .	472
5.3.8	Wiener–Khinchin’s theorem . . . . .	473
<b>6</b>	<b>Statistical tools based on the continuous wavelet transform</b>	<b>473</b>
6.1	Local and global wavelet spectra . . . . .	473
6.2	Relation with Fourier spectrum . . . . .	474
6.3	Application to turbulence . . . . .	475

<b>7</b>	<b>Statistical tools based on the orthogonal wavelet transform</b>	<b>476</b>
7.1	Local and global wavelet spectra . . . . .	476
7.2	Relation with Fourier spectrum . . . . .	477
7.3	Intermittency measures . . . . .	478
<b>III</b>	<b>Computation</b>	<b>478</b>
<b>8</b>	<b>Coherent vortex extraction</b>	<b>478</b>
8.1	CVS filtering . . . . .	478
8.1.1	Vorticity decomposition . . . . .	479
8.1.2	Nonlinear thresholding . . . . .	479
8.1.3	Vorticity and velocity reconstruction . . . . .	480
8.2	Application to a 3D turbulent mixing layer . . . . .	480
8.3	Comparison between CVS and LES filtering . . . . .	481
<b>9</b>	<b>Computation of turbulent flows</b>	<b>484</b>
9.1	Navier–Stokes equations . . . . .	484
9.1.1	Velocity–pressure formulation . . . . .	484
9.1.2	Vorticity–velocity formulation . . . . .	484
9.2	Classical numerical methods . . . . .	485
9.2.1	Direct Numerical Simulation (DNS) . . . . .	485
9.2.2	Modelled Numerical Simulation (MNS) . . . . .	486
9.3	Coherent Vortex Simulation (CVS) . . . . .	487
9.3.1	Principle of CVS . . . . .	487
9.3.2	CVS without turbulence model . . . . .	488
9.3.3	CVS with turbulence model . . . . .	488
<b>10</b>	<b>Adaptive wavelet computation</b>	<b>489</b>
10.1	Adaptive wavelet scheme for nonlinear PDE's . . . . .	489
10.1.1	Time discretization . . . . .	490
10.1.2	Wavelet decomposition . . . . .	490
10.1.3	Evaluation of the nonlinear term . . . . .	492
10.1.4	Subtraction strategy . . . . .	493
10.1.5	Summary of the algorithm . . . . .	494
10.2	Adaptive wavelet scheme for the 2D Navier–Stokes equations . . .	494
10.3	Application to a 2D turbulent mixing layer . . . . .	497
10.3.1	Adaptive wavelet computation . . . . .	497
10.3.2	Comparison between CVS and Fourier pseudo-spectral DNS	497
<b>IV</b>	<b>Conclusion</b>	<b>500</b>

*Course 10. Lagrangian Description of Turbulence**by G. Falkovich, K. Gawedzki and M. Vergassola***505**

<b>1</b>	<b>Particles in fluid turbulence</b>	<b>507</b>
1.1	Single-particle diffusion . . . . .	508
1.2	Two-particle dispersion in a spatially smooth velocity . . . . .	510
1.2.1	General consideration . . . . .	510
1.2.2	Solvable cases . . . . .	515
1.3	Two-particle dispersion in a nonsmooth incompressible flow . . . .	518
1.4	Multiparticle configurations and breakdown of scale-invariance . .	525
1.4.1	Absolute and relative evolution of particles . . . . .	526
1.4.2	Multiparticle motion in Kraichnan velocities . . . . .	527
1.4.3	Zero modes and slow modes . . . . .	529
1.4.4	Perturbative schemes . . . . .	532
<b>2</b>	<b>Passive fields in fluid turbulence</b>	<b>536</b>
2.1	Unforced evolution of passive fields . . . . .	536
2.2	Cascades of a passive scalar . . . . .	538
2.2.1	Passive scalar in a spatially smooth velocity . . . . .	539
2.3	Passive scalar in a spatially nonsmooth velocity . . . . .	543
<b>3</b>	<b>Navier–Stokes equation from a Lagrangian viewpoint</b>	<b>546</b>
3.1	Enstrophy cascade in two dimensions . . . . .	546
3.2	On the energy cascades in incompressible turbulence . . . . .	549
<b>4</b>	<b>Conclusion</b>	<b>551</b>

New trends in turbulence. Turbulence: nouveaux aspects

Les Houches Session LXXIV 31 July - 1 September 2000

Lesieur, M.; Yaglom, A.M.; David, F. (Eds.)

2001, XXXVII, 554 p., Hardcover

ISBN: 978-3-540-42978-4
