

Contents

1	Introduction: Landscape balance and landscape assessment....	1
1.1	Aims and topics of the book.....	1
1.2	Theoretical background: Sustaining and improving of landscape regulation functions.....	2
1.3	Nature areas, landscape units or hydrological response units?.....	7
1.4	Data base and indicators: About difficult dependencies and relationships	12
1.5	Scales and dimensions in landscape ecology: Transformation, aggregation and disaggregation of landscape information	13
1.6	Integrated landscape analysis and assessment as a base for sustainable landscape development: Theory and spatial (and economic) planning practice	14
1.7	Final comments about general trends of German landscape ecology....	18
1.8	References	20
2	History of landscape assessment	23
2.1	Introduction.....	23
2.2	The basis of landscape-ecological assessment	23
2.2.1	The term "landscape"	24
2.2.2	The term (landscape) "assessment"	25
2.3	Use related assessment of landscape components.....	26
2.3.1	Relief.....	26
2.3.2	Soil.....	28
2.3.3	Water.....	29
2.3.4	Climate.....	30
2.3.5	Flora.....	31
2.3.6	Fauna.....	31
2.4	Integrated assessment of the potential and functions of landscapes.....	32
2.4.1	Potential	32
2.4.2	Functions of landscapes	32
2.4.3	Landscape elements, landscape units	33
2.4.4	GIS-aided methods.....	34
2.5	Systemizing different landscape assessment methods.....	35
2.5.1	Unsolved problems in assessment methods and future perspectives	35
2.6	Assessment focal points in German ecosystem research centers	38

2.7	Outlook/ Perspectives.....	41
2.8	References.....	41
3	Databases, data organization and data processing	47
3.1	Introduction.....	47
3.2	The problems faced.....	47
3.3	The need for data resulting from tasks, objectives and specific features of landscape ecological investigations	48
3.3.1	The specific of landscape ecological investigations.....	50
3.3.2	Tasks and objectives of landscape ecological work	50
3.3.3	The role of geographical dimensions and scales	51
3.3.4	The need for data	53
3.4	Types of data, data sources and methods of data acquisition.....	53
3.4.1	Topographic information	53
3.4.2	Thematic information.....	60
3.5	Remote sensing data.....	70
3.5.1	Aerial photography and satellite imagery.....	71
3.5.2	Development of the use of instruments	71
3.5.3	The importance of resolution	75
3.5.4	Landscape balance	76
3.5.5	Outlook	79
3.6	GIS and models - important tools for landscape analysis and landscape assessment.....	79
3.7	References.....	84
4	Researching state and dynamics in landscape using remote sensing.....	87
4.1	Image processing.....	87
4.1.1	Image correction, enhancement, and manipulation	87
4.1.2	Visual image interpretation.....	90
4.1.3	Quantitative analysis of classified images.....	91
4.1.4	Examples of quantitative approaches to image classifications	93
4.2	Possibilities and limitations for land use monitoring with remote sensing data and GIS methods	102
4.2.1	The role of remote sensing data in urban and regional monitoring	102
4.3	Conclusion and outlook.....	110
4.4	References.....	111
5	The analysis of spatio-temporal dynamics of landscape structures.....	113
5.1	Concept of landscape ecology.....	113
5.2	The purpose of the spatio-temporal analysis of landscapes	114
5.3	Concept of landscape metrics.....	115
5.4	Types of landscape metrics and processing of satellite data	117

5.5	Demonstration of the hierarchical approach for a particular mining region in Germany.....	121
5.6	Possibilities and limitations when quantifying landscape metrics.....	131
5.7	Conclusion	132
5.8	References	134
6	Scales and spatio-temporal dimensions in landscape research	137
6.1	Introduction	137
6.2	Theory of geographic dimensions	138
6.2.1	The terms 'scale' and 'dimension'	138
6.2.2	Hierarchy theory.....	139
6.2.3	The problem of homogeneity and heterogeneity	144
6.2.4	Landscape heterogeneity and change	146
6.3	Scales and dimensions in landscape ecology	149
6.4	Regionalization in landscape ecology	152
6.5	Examples for cross-scale and scale-specific investigations.....	156
6.6	Discussion and conclusion	157
6.7	Outlook.....	158
6.8	References	160
7	Landscape balance	163
7.1	Introduction	163
7.2	Interactions between landscape structures and processes.....	167
7.3	Fluxes of matter, energy and information in landscapes	169
7.3.1	Vertical and horizontal fluxes and processes.....	169
7.3.2	Scale specific and cross scale investigations	171
7.4	Water carried fluxes of nutrients and pollutants.....	172
7.4.1	Investigation methods	172
7.4.2	GIS-coupled modelling on different scales	172
7.5	Theory: A scale-specific hierarchical approach	176
7.6	The study areas.....	179
7.6.1	The Dessau district.....	180
7.6.2	The Parthe river watershed.....	180
7.7	'Top down': balancing - modeling - typifying.....	181
7.8	'Bottom-up': measuring - mapping - modeling.....	187
7.9	Discussion and conclusions	194
7.10	Outlook.....	196
7.11	References	197
8	Landscape assessment.....	203
8.1	Introduction	203
8.2	Assessment of landscape structures at the topological level for the conclusion of development goals in agricultural landscapes.....	206

8.2.1 Topological dimension and assessment	206
8.2.2 Primary and secondary landscape structure	209
8.2.3 Regional landscape structure assessments and environmental quality objectives	213
8.2.4 Advantages and disadvantages of landscape structure assessments	214
8.3 Using GIS for landscape ecological assessments and multicriteria optimization for the Barnstädt test area.....	216
8.3.1 Introduction.....	216
8.3.2 Initial questions and functional assessment.....	218
8.3.3 Geocological assessment of the current state of the landscape.....	221
8.3.4 Significance of scenarios within the methodology for land use options	221
8.3.5 Results.....	235
8.3.6 Summary.....	235
8.4 Polyfunctional assessment of landscapes using landscape units	237
8.4.1 The conflict between segregating and integrating the protection of natural resources	237
8.4.2 Landscape units and landscape types	239
8.4.3 Functional assessments	239
8.4.4 Polyfunctionale Assessment.....	241
8.4.5 Summary.....	243
8.5 GIS-based landscape assessment	243
8.6 References.....	246

9 Landscape function assessment and regional planning: Creating knowledge bases for sustainable landscape development.....251

9.1 Introduction.....	251
9.2 The key position of the region for landscape analysis and spatial development	252
9.3 Multifunctional landscapes and sustainable development.....	253
9.4 Normative dimensions of landscape development.....	255
9.5 Instruments and processes of landscape related regional planning	256
9.6 A landscape function assessment procedure for the Dessau region	259
9.6.1 The Dessau region.....	259
9.6.2 Methods of landscape analysis and evaluation.....	261
9.6.3 Assessing the renewal of groundwater resources of the Dessau region	265
9.6.4 Assessing the capacity for agricultural production.....	268
9.6.5 Assessing the water and matter retention	270
9.6.6 Integrating landscape functions: conflicts and complementarities of planning objectives	273
9.7 Conclusions.....	277
9.8 References.....	279

10	Decision support for land use changes - A combination of methods for policy advising and planning.....	281
10.1	Introduction.....	281
10.2	Characterization of the two methods with an integrated concept.....	282
10.2.1	The Querfurt method - A concept for landscape assessment and optimization	282
10.2.2	The Torgau method - A concept for assessing alternative options in conflict situations	285
10.3	Combining the Querfurt and Torgau methods.....	289
10.4	Discussion	294
10.5	References	296
Index	299

Landscape Balance and Landscape Assessment

Krönert, R.; Steinhardt, U.; Volk, M. (Eds.)

2001, IX, 304 p., Hardcover

ISBN: 978-3-540-67399-6
