Lecture 1. Supergravity

by B. de Wit 1

1 Introduction	3
2 Supersymmetry in various dimensions	4
2.1 The Poincaré supersymmetry algebra	5
2.2 Massless supermultiplets	7
2.2.1 $D = 11$ supermultiplets	8
2.2.2 $D = 10$ supermultiplets	9
2.2.3 $D = 6$ supermultiplets	13
2.3 Massive supermultiplets	17
2.4 Central charges and multiplet shortening	19
2.5 On spinors and the R-symmetry group H_R	22
3 Supergravity	28
3.1 Simple supergravity	28
3.2 Maximal supersymmetry and supergravity	32
3.3 $D = 11$ supergravity	35
3.4 Dimensional reduction and hidden symmetries	38
3.5 Frames and field redefinitions	43
3.6 Kaluza–Klein states and BPS-extended supergravity	46
3.7 Nonmaximal supersymmetry: $Q = 16$	53
4 Homogeneous spaces and nonlinear sigma models	55
4.1 Nonlinearly realized symmetries	56
4.2 Geometrical quantities	61
4.3 Nonlinear sigma models with homogeneous target space	66
4.4 Gauged nonlinear sigma models	69

5	Gauged maximal supergravity in 4 and 5 dimensions	70
5.1	On $E_{7(7)}/SU(8)$ and $E_{6(6)}/USp(8)$ cosets	72
5.2	On ungauged maximal supergravity Lagrangians	74
5.3	Electric–magnetic duality and $E_{7(7)}$	79
5.4	Gauging maximal supergravity; the T -tensor	84
6	Supersymmetry in anti-de Sitter space	89
6.1	Anti-de Sitter supersymmetry and masslike terms	93
6.2	Unitary representations of the anti-de Sitter algebra	97
6.3	The superalgebras $OSP(N 4)$	110
7	Superconformal symmetry	116
7.1	The superconformal algebra	119
7.2	Superconformal gauge theory and supergravity	122
7.3	Matter fields and currents	126

Lecture 2. Supersymmetric Gauge Theories

by D.S. Berman and E. Rabinovici 137

1	Introduction	141
2	Supersymmetric quantum mechanics	143
2.1	Symmetry and symmetry breaking	151
2.2	A nonrenormalisation theorem	152
2.3	A two variable realization and flat potentials	154
2.4	Geometric meaning of the Witten index	158
2.5	Landau levels and SUSY QM	159
2.6	Conformal quantum mechanics	161
2.7	Superconformal quantum mechanics	164
3	Review of supersymmetric models	165
3.1	Kinematics	165
3.2	Superspace and chiral fields	167
3.3	Kähler potentials	169
3.4	F-terms	170
3.5	Global symmetries	170
3.6	The effective potential	172
3.7	Supersymmetry breaking	172
3.8	Supersymmetric gauge theories	173
4	Phases of gauge theories	179

5	Supersymmetric gauge theories/super QCD	180
5.1	The classical moduli space	182
5.2	Quantum moduli spaces	185
5.3	Quantum moduli space for $0 < N_F < N_C$	185
5.4	Integrating in	186
5.5	Quantum moduli space for $N_F \geq N_C$	190
5.6	$N_F = N_C$	190
5.7	$N_F = N_C + 1$	191
5.8	Higgs and confinement phases	192
5.9	Infra-red duality	194
5.10	Superconformal invariance in $d = 4$	202
6	Comments on vacuum energies in scale invariant theories	207
7	Supersymmetric gauge theories and string theory	210
7.1	Branes in string theory	210
7.2	Branes in IIA and IIB string theories	211
7.3	The effective field theory on branes	213
7.4	Effective $D = 4$ dimensional systems with $N = 2$ supersymmetry	216
7.5	An effective $D = 4$, $N = 1$, $U(N_C)$ gauge theory with matter	226
7.6	More pieces of information	229
7.7	Obtaining the dual field theory	233
7.8	Concluding remarks	235
8	Final remarks	237

*Lecture 3. An Introduction to Duality Symmetries
in String Theory*

by A. Sen 241

1	Introduction	243
2	A brief review of perturbative string theory	245
2.1	The spectrum	246
2.2	Interactions	251
2.3	Compactification	254
3	Notion of duality symmetries in string theory	255
3.1	Duality symmetries: Definition and examples	255
3.2	Testing duality conjectures	258

4	Analysis of low energy effective field theory	260
4.1	Type I- $SO(32)$ heterotic duality in $D = 10$	261
4.2	Self-duality of heterotic string theory on T^6	264
4.3	Duality between heterotic on T^4 and type IIA on K3	268
4.4	$SL(2, Z)$ self-duality of type IIB in $D = 10$	272
4.5	Other examples	274
5	Precision test of duality: Spectrum of BPS states	276
5.1	$SL(2, Z)$ S -duality in heterotic on T^6 and multi-monopole moduli spaces	280
5.2	$SL(2, Z)$ duality in type IIB on S^1 and D-branes	286
5.3	Massless solitons and tensionless strings	296
6	Interrelation between different duality conjectures	299
6.1	Combining non-perturbative and T -dualities	299
6.2	Duality of dualities	299
6.3	Fiberwise duality transformation	301
6.4	Recovering higher dimensional dualities from lower dimensional ones	304
7	Duality in theories with less than sixteen supersymmetry generators	305
7.1	Construction of a dual pair of theories with eight supercharges . .	306
7.2	Test of duality conjectures involving theories with eight supercharges	309
8	M-theory	312
8.1	M-theory in eleven dimensions	312
8.2	Compactification of M-theory	315

Lecture 4. Les Houches Lectures on Large N Field Theories and Gravity
by J. Maldacena 323

1	General introduction	325
2	The correspondence	330
2.1	The field \leftrightarrow operator correspondence	336
2.2	Holography	338
3	Tests of the AdS/CFT correspondence	341
3.1	The spectrum of chiral primary operators	342
3.1.1	The field theory spectrum	342
3.1.2	The string theory spectrum and the matching	348
3.2	Matching of correlation functions and anomalies	351

4	Correlation functions	353
4.1	Two-point functions	355
4.2	Three-point functions	359
5	Wilson loops	362
5.1	Wilson loops and minimum surfaces	363
5.2	Other branes ending on the boundary	368
6	Theories at finite temperature	369
6.1	Construction	369
6.2	Thermal phase transition	372

*Lecture 5. D-Branes on the Conifold
and $\mathcal{N} = 1$ Gauge/Gravity Dualities*

by I.R. Klebanov, C.P. Herzog and P. Ouyang 383

1	Introduction	385
2	D3-branes on the conifold	388
2.1	Dimensions of chiral operators	391
2.2	Wrapped D3-branes as “dibaryons”	393
2.3	Other ways of wrapping D-branes over cycles of $T^{1,1}$	394
3	The RG cascade	397
3.1	Matching of the β -functions	400
4	The chiral anomaly	402
4.1	The anomaly as a classical effect in supergravity	403
4.2	The anomaly as spontaneous symmetry breaking in AdS_5	405
5	Deformation of (KS) the conifold	410
5.1	The first-order equations and their solution	412
5.2	$SO(4)$ invariant expressions for the 3-forms	413
6	Infrared physics	414
6.1	Dimensional transmutation and confinement	414
6.2	Tensions of the q -strings	416
6.3	Chiral symmetry breaking and gluino condensation	418

Lecture 6. De Sitter Space

by M. Spradlin, A. Strominger and A. Volovich 423

1	Introduction	425
----------	---------------------	------------

2	Classical geometry of de Sitter space	427
2.1	Coordinate systems and Penrose diagrams	428
2.2	Schwarzschild-de Sitter	435
2.3	Geodesics	436
3	Quantum field theory on de Sitter space	437
3.1	Green functions and vacua	437
3.2	Temperature	440
3.3	Entropy	443
4	Quantum gravity in de Sitter space	446
4.1	Asymptotic symmetries	446
4.2	De Sitter boundary conditions and the conformal group	447
A	Calculation of the Brown-York stress tensor	451

*Lecture 7. String Compactification
with $\mathcal{N} = 1$ Supersymmetry*

by M.R. Douglas 455

1	Introduction and the question of vacuum selection	457
2	From ten dimensional geometry to four dimensional effective field theory	461
3	D-branes with stringy corrections	466
4	Quantum corrections	470
5	Towards the low energy theory of everything	472

*Lecture 8. Lectures on Open Strings,
and Noncommutative Gauge Theories*

by N.A. Nekrasov 477

1	Introduction	479
2	Background independence	480
2.1	Dolan-Nappi solutions	483
2.2	Intersecting branes	485
2.3	T -duality	485

3	BPS algebras	486
3.1	Noncommutative $U(1)$ instantons	486
3.2	Higher dimensional instantons	489
4	Fermions in the \mathbf{Y} background	490
4.1	Fermions in the instanton background	490
4.2	The Dirac field in the monopole background	491
5	Non-trivial backgrounds	492
5.1	Example: $\Gamma = \mathbf{Z}_2$	493
6	Conclusions and outlook	494

*Lecture 9. Condensates Near the Argyres-Douglas Point
in $SU(2)$ Gauge Theory with Broken $\mathcal{N} = 2$ Supersymmetry*

by A. Gorsky 497

1	Introduction	499
2	Matter and gaugino condensates	501
3	Dyon condensates	504
3.1	Monopole condensate	505
3.2	Charge and dyon condensates	506
4	The Argyres-Douglas point: How well the theory is defined	508
5	Conclusions	509

Seminar 1. Quantum Field Theory with Extra Dimensions

by L. Baulieu 513

1	Introduction	515
2	The fields	516
3	The action at level n	518

*Seminar 2. Special Holonomy Spaces and M-Theory*by *M. Cvetič, G.W. Gibbons, H. Lü and C.N. Pope* 523

1	Introduction	525
2	Resolution <i>via</i> transgression	527
2.1	Motivation	527
2.2	Resolved M2-brane	528
2.3	Resolved D2-brane	529
2.4	Other examples	529
3	Special holonomy spaces, harmonic forms and resolved branes	530
3.1	Harmonic forms for the Stenzel metric	531
3.1.1	Stenzel metric	531
3.1.2	Harmonic middle-dimension (p, q) forms	532
3.2	Old G_2 holonomy metrics and their harmonic forms	533
3.2.1	Resolved cones over $S^2 \times S^4$ and $S^2 \times \mathbf{CP}^2$	533
3.2.2	Resolved cone over $S^3 \times S^3$	534
3.3	New $Spin(7)$ holonomy metrics and their harmonic forms	534
3.3.1	The old metric and harmonic 4-forms	534
3.3.2	The new $Spin(7)$ holonomy metric	535
3.4	Applications: Resolved M2-branes and D2-branes	536
4	New G_2 holonomy metrics	537
4.1	Classification of G_2 holonomy spaces with $S^3 \times S^3$ orbits	537
5	Conclusions and open avenues	541

*Seminar 3. Four Dimensional Non-Critical Strings*by *F. Ferrari* 547

1	Introduction	549
2	Many paths to the gauge/string duality	550
2.1	Confinement	550
2.2	Large N	551
2.3	D-branes	552
2.4	Non-critical strings	554
3	Four dimensional non-critical strings	559
3.1	Four dimensional CFTs as Kazakov critical points	562
3.2	Instantons and large N	564
3.3	A toy model example	566
3.4	Exact results in 4D string theory	569
3.5	Further insights	571

3.5.1	Full proofs	571
3.5.2	Non-perturbative non-Borel summable partition functions .	572
4	Open problems	572
 <i>Seminar 4. U-Opportunities: Why is Ten Equal to Ten?</i>		
	<i>by B. Julia</i>	<i>575</i>
1	Classifications	577
2	Real forms of Lie algebras	581
3	Chaos controlled by symmetry	583
 <i>Seminar 5. Exact Answers to Approximate Questions – Noncommutative Dipoles, Open Wilson Lines and UV-IR Duality</i>		
	<i>by Soo-Jong Rey</i>	<i>587</i>
1	Introduction and conjectures	589
2	Flying noncommutative dipole	591
3	Open wilson lines: How and why?	593
3.1	Open Wilson lines	593
3.2	Generalized star products	595
4	Free and interacting OWLs	597
4.1	Free OWLs	598
4.2	Interacting OWLs	600
5	Closed strings out of open strings	604
5.1	Open strings as miniature dipoles	604
5.2	Witten's \star_w -product is Moyal's \star_m -product	605
5.3	Closed strings as OWLs	607
 <i>Seminar 6. Open-String Models with Broken Supersymmetry</i>		
	<i>by A. Sagnotti</i>	<i>611</i>
1	Broken supersymmetry and type-0 models	613

2	Scherk-Schwarz deformations and brane supersymmetry	618
3	Brane supersymmetry breaking	620

*Seminar 7. On a Field Theory of Open Strings, Tachyon
Condensation and Closed Strings*

by S.L. Shatashvili 627

Seminar 8. Exceptional Magic

by S.L. Shatashvili 643

1	G_2	648
2	$Spin(7)$	657
3	Topological twist	661

Unity from Duality: Gravity, Gauge Theory and Strings

Les Houches Session LXXVI, July 30 - August 31, 2001

Bachas, C.P.; Bilal, A.; Douglas, M.R.; Nekrasov, N.A.;

David, F. (Eds.)

2002, XXXIV, 664 p., Hardcover

ISBN: 978-3-540-00276-5
