

Table of Contents

A Primitive Approach to Aeroacoustics

<i>Avraham Hirschberg, Christophe Schram</i>	1
1 Introduction	1
2 Fluid Dynamics	2
3 Lighthill's Analogy	4
4 Jet Noise	7
5 Thermo-Acoustics	9
6 Acoustical Energy	10
7 Rijke-Tube	11
8 Vortex-Sound Theory	14
9 Choice of the Green's Function	17
10 Howe's Energy Corollary	20
11 The Open Pipe Termination of an Unflanged Pipe	21
12 Whistler-Nozzle and Human Whistling	25
13 Conclusion	27
References	28

Lectures on the Theory of Vortex-Sound

<i>Michael S. Howe</i>	31
1 Aerodynamic Sound	31
1.1 Lighthill's Acoustic Analogy (1952)	31
1.2 Aerodynamic Sound from Low-Mach-Number Turbulence of Uniform Mean Density	34
1.3 Aerodynamic Sound from Low-Mach-Number Turbulence of Variable Mean Density	35
2 Vorticity and Entropy Fluctuations as Sources of Sound	37
2.1 The Rôle of Vorticity in Lighthill's Theory	37
2.2 Acoustic Analogy in Terms of the Total Enthalpy	39
2.3 Vorticity and Entropy Sources	40
3 Fundamental Solutions of the Wave Equation	43
3.1 The Helmholtz Equation	43
3.2 The Wave Equation	46
4 General Solution of the Inhomogeneous Wave Equation	47
4.1 General Solution in the Frequency-Domain	47

4.2	General Solution in the Time-Domain	49
5	Compact Green's Functions	49
5.1	Time-Harmonic Problems	50
5.2	Time-Domain Problems	52
6	Influence of Solid Bodies on the Generation of Aerodynamic Sound	58
6.1	Integral Representation of Aerodynamic Sound	58
6.2	Curle's Theory Applied to Compact Bodies	60
6.3	Vortex Sound	61
6.4	Influence of Vortex Shedding	62
7	Vortex-Airfoil Interaction Noise	66
7.1	Blade-Vortex Interactions in Two-Dimensions	67
7.2	Three-Dimensional Interactions	70
7.3	Blade-Vortex Interactions in Three Dimensions	71
8	Vorticity Production by Sound	74
8.1	Interaction of Sound with a Solid Surface	75
8.2	Interactions at a Trailing Edge	78
8.3	Leading Edge Interactions	80
8.4	Application to Resonant Oscillations	83
9	Perforated Screens	85
9.1	Rayleigh Conductivity	85
9.2	The Bias Flow Aperture	87
9.3	Reflection and Transmission of Sound by a Perforated Screen ..	91
10	Compression Wave Generated when a Train Enters a Tunnel	94
10.1	The Governing Equations	96
10.2	Linear Theory	98
10.3	Contribution from the Surface Dipoles	102
10.4	Contribution from the Exit Flow Vorticity	103
11	The Flared Portal	104
11.1	Suppression of the Micro-pressure Wave	104
11.2	The Function φ^*	105
11.3	Optimal Flaring	106
11.4	Comparison with Measurements	107
	References	110

Sound–Vortex Interaction in Infinite Media

	<i>Fernando Lund</i>	112
1	Introduction	112
2	The Basics – Vortex Sound	113
2.1	Incompressible Flow	113
2.2	Slightly Compressible Flow	115
2.3	Incompressible Vortex Dynamics	117
2.4	Vortex Sound	119
2.5	Bibliographical Notes	121
3	Scattering of Sound by Vorticity	122

3.1	Kelvin's Theorem	122
3.2	Scattering to Order M	125
3.3	Bibliographical Notes	129
4	Two Dimensions	131
4.1	Vanishing Circulation	131
4.2	Surface Waves	132
4.3	Shallow Water	135
4.4	Deeper Water	139
4.5	Experimental Results	140
4.6	Bibliographical Notes	141
5	Multiple Scattering	143
5.1	Equations to Order M^2	144
5.2	Appendix	148
5.3	Example: a "Gas" of Vortices	151
5.4	Two Dimensions	152
5.5	Three Dimensions	154
5.6	Bibliographical Notes	154
6	Loose Ends	156
6.1	Optical Theorem	156
6.2	Validity of the Born Approximation	158

Geometrical Acoustics in Moving Media

	<i>Vladimir E. Ostashev</i>	160
1	Introduction	160
2	Linearized Equations of Fluid Dynamics	161
3	Solution of Linearized Equations of Fluid Dynamics	162
3.1	Debye Series	162
3.2	Eikonal Equation	163
3.3	Dispersion Equation	163
3.4	Transport Equation	163
3.5	Conservation of Acoustic Energy	163
4	Geometrical Acoustics in a Three-Dimensional Inhomogeneous Medium	164
4.1	Group and Phase Velocities	164
4.2	Ray Path	165
4.3	Eikonal and Time of Sound Propagation	165
4.4	Amplitude of the Sound Pressure	166
5	Geometrical Acoustics in a Stratified Medium	166
5.1	Refraction Law for the Unit Vector \mathbf{n}	166
5.2	Refraction Law for the Unit Vector \mathbf{s}	167
5.3	The Ray Path	168
5.4	Eikonal	168
	References	168

Sound Propagation and Scattering in Random Moving Media
Vladimir E. Ostashev..... 169

1 Introduction 169

2 Equations for a Sound Wave in a Random Moving Medium 170

 2.1 Helmholtz-Type Equation..... 170

 2.2 Parabolic Equation 171

 2.3 Parabolic Equation in a Refractive Medium 172

3 Statistical Description of Random Inhomogeneities 172

 3.1 Correlation Functions and Spectral Densities 172

 3.2 Energy, Inertial, and Dissipation Subranges 173

 3.3 Kolmogorov Spectrum..... 173

 3.4 Gaussian Spectrum 174

 3.5 von Kármán Spectrum 174

4 Scattering of Sound..... 177

 4.1 Sound Scattering Cross-Section 177

 4.2 von Kármán Spectrum 178

5 Line-of-Sight Sound Propagation in a Random Moving Medium ... 178

 5.1 Statistical Moments of a Sound Field..... 179

 5.2 Effective Correlation Function and Spectral Density..... 180

 5.3 Markov Approximation 180

 5.4 Rytov Method..... 180

 5.5 Formulas for Statistical Moments of a Sound Field 181

 5.6 Coherence Function 183

6 Interference of the Direct and Ground-Reflected Waves 184

 6.1 Mean Squared Sound Pressure..... 185

 6.2 Comparison with Experimental Data 186

7 Sound Propagation Near Impedance Ground
 in a Refractive, Turbulent Atmosphere 187

 7.1 Mean Sound Field 188

 7.2 Coherence Function 188

References 190

**Plasma-Hydrodynamic Analogy
for Waves and Vortices in Shear Flows**
Anatoly Fabrikant..... 192

1 Research Philosophy 192

2 Resonant Wave-Flow Interactions 194

3 Negative Wave Energy and Over-Reflection 199

4 Acoustic Analogues of Microwave Devices: Monotron and Klystron 201

5 Wave-Vortex Interactions..... 206

6 Analogies Table 208

New Linear Mechanisms of Acoustic Wave Generation in Smooth Shear Flows (Nonmodal Study)

<i>George D. Chagelishvili</i>	210
1 Introduction	210
1.1 Basic Problems in Shear Flows	210
1.2 Essence of the Difficulties of the Modal Approach	211
1.3 Onto Nonmodal Approach	211
2 Mathematics of the Study	213
2.1 Types of Disturbances	216
2.2 Onto the Value of Shear Rate	217
3 The Dynamics of SFH of Acoustic Waves	217
3.1 Velocity Field of SFH of Acoustic Waves	218
3.2 The Dynamics of SFH of Acoustic Waves: Low Shear Rates ..	220
3.3 The Dynamics of SFH of Acoustic Waves: Moderate Shear Rates	222
4 The Dynamics of the SFH of Vortices	223
4.1 Conversion of Vortices to Waves	224
4.2 The Nature of the Conversion Phenomenon	226
4.3 Onto the Amplitude of the Generated Wave SFH at Conversion	227
4.4 Demonstration of the Conversion Phenomenon by Direct Numerical Calculation	227
4.5 Onto the Vortex-Wave Interaction	230
5 Mutual Transformation of Waves	230
5.1 Mechanical Analogy	231
5.2 Qualitative Description of the Resonance Transformation of Waves	231
6 Conclusion	234
References	235

Singular Eigenfunctions and an Integral Transform for Shear Flow

<i>Philip J. Morrison</i>	238
1 Introduction	238
2 Shear Flow	238
2.1 Equilibrium and Linearization	239
2.2 Singular Eigenmodes and the Continuous Spectrum	240
3 The Integral Transform–Coordinate Change	243
3.1 Integral Transform Pair	243
3.2 Solution	245
4 Hamiltonian Interpretation	245
References	246

Structural Acoustics with Mean Flow
Nigel Peake 248

1 Basic Problem 248

2 Solution Technique 250

3 Solution for Fluid-Loaded Plate with Mean Flow 253

 3.1 Wave Energy 254

4 Modifications to the Basic Model 257

 4.1 Plate Curvature 257

 4.2 Nonlinear Motion 259

 4.3 Effects of a Boundary Layer 262

5 Conclusion 263

References 264

Nonlinear Acoustics and Acoustic Chaos
Werner Lauterborn 265

1 Introduction 265

2 Origin of Nonlinearity 266

3 Equation of State 266

4 Simple Nonlinear Waves 268

5 Shock Waves 270

6 Sonoluminescence 272

7 Chaos Physics 276

8 Acoustic Chaos 280
