

TABLE OF CONTENTS

1. INTRODUCTION	1
2. MATHEMATICAL MODELS.....	3
2.1. Differential equations	3
2.2. Transfer function	7
2.3. State equations.....	8
2.4. Models of standards.....	16
2.5. Examples	22
3. SYSTEM PARAMETERS.....	37
3.1. Overshoot	37
3.2. Damping factor	38
3.3. Half-time.....	39
3.4. Equivalent time delay	39
3.5. Time constants.....	40
3.6. Resonance angular frequency	41
4. MODEL SYNTHESIS.....	43
4.1. Algebraic polynomials.....	43
4.2. The least squares method.....	45
4.3. Cubic splines.....	47
4.4. Square of frequency response method	51
4.5. The Maclaurin series method.....	53
4.6. Multi-inertial models	56
4.7. Weighted means method	61
4.8. Smoothing functions.....	66
4.9. Kalman filter.....	68
4.10. Examples	70
5. SIMPLIFICATION OF MODELS	84
5.1. The least-squares approximation	85
5.2. The Rao-Lamba method	92
5.3. Criterion of consistency of model response derivatives at the origin	93
5.4. Reduction of state matrix order with selected eigenvalues retained.....	94
5.5. Simplification of models using the Routh table coefficients.....	99
5.6. Simplification of models by means of Routh table and Schwarz matrix	100
5.7. Simplification of models by comparison of characteristic equation coefficients	106

VI Contents

5.8. Examples	107
6. MAXIMUM MAPPING ERRORS	124
6.1. Input signals with one constraint	125
6.2. Input signals with two constraints	134
6.3. Examples	138
7. SIGNALS MAXIMISING THE INTEGRAL-SQUARE-ERROR IN THE PROCESS OF MODELS OPTIMISATION	143
7.1. Optimisation of models in the case of the high value of primary mapping error. Optimisation of Butterworth filters	144
7.2. Examples	145
7.3. Optimisation of models in the case of the small value of primary mapping error	159
7.4. Examples	159
