

Contents

Part I. General Formalism

1. The Many Faces of Transport	3
2. Classical Mechanics	7
2.1 Generalized Coordinates and Constraints	7
2.2 d'Alembert's Principle	8
2.3 Reduction of Dynamics to Statics	10
2.4 The Lagrangian and Euler–Lagrange Equations	11
2.5 Maupertuis and Maserati	11
2.6 From Lagrangian to Hamiltonian	12
2.7 Phase Space and Configuration Space	14
2.8 The Liouville Equation	15
2.9 The Micro-Canonical Ensemble	16
2.10 The Boltzmann Equation	18
2.11 Drude's Model of Carrier Transport	21
2.12 Currents in Semiconductors	23
3. Mathematical Interlude	27
3.1 Generalized Functions	27
3.1.1 The Step Function $\theta(x)$	27
3.1.2 The Delta Function $\delta(x)$	28
3.1.3 Some Useful Relations	28
3.2 Functions of Functions – Functionals	29
3.3 Functional Integration – Path Integrals	30
3.4 Vector Identities	31
3.5 A Few Theorems	32
Exercises	33
4. Quantum Mechanics	35
4.1 Rules of the Game	35
4.1.1 States in Fock Space	35
4.1.2 The Superposition Principle	36
4.1.3 Scalar Products and Probability Amplitudes	36
4.1.4 Observable Quantities and Operators	36

4.1.5	Measurements and Expectation Values	37
4.1.6	Dynamics – The Schrödinger Equation	38
4.2	The Book of Recipes	39
4.2.1	First Recipe – Correspondence Principle	40
4.2.2	Second Recipe – Canonical Commutation Rules	40
4.2.3	Third Recipe – Use Your Imagination	40
4.2.4	Fourth Recipe – Choose an Appropriate Basis	40
4.3	The Position and Momentum Representation	43
4.3.1	Position Representation	43
4.3.2	Momentum Representation	44
4.3.3	Stationary Schrödinger Equation	44
4.4	Commuting Operators, ‘Good’ Quantum Numbers	44
4.5	Path Integrals	46
	Exercises	51
5.	Single-Particle Quantum Mechanics	53
5.1	Charge Density, Current and Single Particle Wave Functions	53
5.2	Constant Potential, Energy Bands and Energy Subbands	54
5.3	Potential Wells	58
5.4	Potential Barriers	62
5.5	Electromagnetic Fields	71
5.6	Spin	73
	Exercises	77
6.	Second Quantization	79
6.1	Identical Particles	79
6.2	Field Operators	83
6.2.1	Definition	83
6.2.2	Field Operators, Wave Functions and Topology	84
6.2.3	Field Operators in Fock Space	85
6.2.4	The Connection to First Quantization	88
6.2.5	How to Construct the Operators	90
6.3	More Creation and Annihilation Operators	94
6.3.1	The Electron Hamiltonian	96
6.3.2	The Number Operator	96
6.3.3	Charge and Current Density	96
6.3.4	Many-Particle Ground State of a Non-Interacting System	96
	Summary	98
	Exercise	98

7. Equilibrium Statistical Mechanics	99
7.1 The Entropy Principle	99
7.2 The Canonical and Grand-Canonical Ensembles	101
7.3 Quantum Statistical Physics	104
7.4 Quantum Ensembles	106
7.5 Photons and Phonons – Some Partition Functions	107
7.6 Preview of Non-equilibrium Theory	111
Exercises	114
8. Non-equilibrium Statistical Mechanics	115
8.1 Definition of the Problem	115
8.2 Hydrodynamics	117
8.2.1 A First Glance at Entropy	119
8.2.2 Deriving Fourier's Law	120
8.2.3 A Second Glance at Entropy	126
8.3 Matsubara Functions	127
Exercise	130
9. Wigner Distribution Functions	131
10. Balance Equations	137
10.1 Basic Assumptions	137
10.2 Charge and Current Density	138
10.3 Total Hamiltonian	139
10.4 Basic Equations of Motion	139
10.5 Continuity Equation	140
10.6 Energy Balance Equation	141
10.7 Linear and Angular Momentum Balance Equation	145
10.8 Calculation of the DC Current	146
10.8.1 Gedankenexperiment	147
10.8.2 Equilibrium Currents and Broken Time Reversal Symmetry	147
10.8.3 Perturbative Solution Scheme	150
Exercise	154

Part II. Applications

11. Velocity–Field Characteristics of a Silicon MOSFET	157
11.1 Momentum and Energy Balance Equations for a MOSFET Channel	157
11.2 Calculation of the Elementary Green Functions	162

12. Gate Leakage Currents	169
12.1 Subband States and Resonances	170
12.2 Tunneling Gate Currents	177
12.3 Results of the Gate-Leakage Current Calculations	184
13. Quantum Transport in Vertical Devices	189
13.1 Quantum Transport in a Cylindrical MOSFET	190
13.2 The Hamiltonian of the System	191
13.3 The Liouville Equation	193
13.4 Electron Scattering	198
13.5 The Numerical Model	200
13.6 Numerical Results	202
Summary	207
14. An Exactly Solvable Electron–Phonon System	209
14.1 The Time Dependent Drift Velocity for the CL Model	210
14.2 Solution of the Transport Equation	213
14.3 How to Invert Laplace Transforms	215
14.4 Irreversibility and the Ohmic Case	216
14.5 Entropy Production	218
Summary	219
15. Open Versus Closed Systems	221
16. Conductance Quantization	225
16.1 Circuit Topology, Non-Conservative Fields and Dissipationless Transport	226
16.2 Quantum Rings	229
16.3 Hamiltonian and Current Response	235
16.4 Open Versus Closed Circuits	240
16.5 Energy Dissipation Versus Current Limitation	241
16.6 Flux Quantization	242
16.7 Localization of the Electric Field	243
16.8 A Quantum Lenz’ Law?	243
17. Transport in Quantum Wires	245
17.1 Balance Equations for an Imperfect Quantum Wire	245
17.2 Current–Voltage Characteristics and Local Energy Dissipation	248
18. Future Work	251
18.1 Constructing Non-equilibrium Ensembles	251
18.1.1 Covariance in Classical Physics	253
18.1.2 Canonical Quantization	255
18.1.3 Path-Integral Quantization	255

18.1.4 Guessing a Density Function	258
18.2 Quantum Circuit Theory	259
References	261
Index	265

Quantum Transport in Submicron Devices

A Theoretical Introduction

Magnus, W.; Schoenmaker, W.

2002, XVII, 270 p., Hardcover

ISBN: 978-3-540-43396-5
