

Contents

1. Introduction	1
1.1 Martensitic Transformations and Quasiconvex Hulls	3
1.2 Outline of the Text	8
2. Semiconvex Hulls of Compact Sets	11
2.1 The Eight Point Example	13
2.2 Sets Invariant Under $SO(2)$	26
2.3 The Thin Film Case	49
2.4 An Optimal Taylor Bound	51
2.5 Dimensional Reduction in Three Dimensions	53
2.6 The Two-well Problem in Three Dimensions	55
2.7 Wells Defined by Singular Values	57
3. Macroscopic Energy for Nematic Elastomers	69
3.1 Nematic Elastomers	70
3.2 The General Relaxation Result	72
3.3 An Upper Bound for the Relaxed Energy	75
3.4 The Polyconvex Envelope of the Energy	77
3.5 The Quasiconvex Envelope of the Energy	80
4. Uniqueness and Stability of Microstructure	83
4.1 Uniqueness and Stability in Bulk Materials	86
4.2 Equivalence of Uniqueness and Stability in 2D	101
4.3 The Case of $O(2)$ Invariant Sets	102
4.4 Applications to Thin Films	109
4.5 Applications to Finite Element Minimizers	115
4.6 Extensions to Higher Order Laminates	120
4.7 Numerical Analysis of Microstructure – A Review	122
5. Applications to Martensitic Transformations	127
5.1 The Cubic to Tetragonal Transformation	128
5.2 The Cubic to Trigonal Transformation	134
5.3 The Cubic to Orthorhombic Transformation	135
5.4 The Tetragonal to Monoclinic Transformations	143
5.5 Reduction by Symmetry Operations	151

6. Algorithmic Aspects	153
6.1 Computation of Envelopes of Functions	154
6.2 Computation of Laminates	163
7. Bibliographic Remarks	177
7.1 Introduction	177
7.2 Semiconvex Hulls of Compact Sets	178
7.3 Macroscopic Energy for Nematic Elastomers	179
7.4 Uniqueness and Stability	180
7.5 Applications to Martensitic Transformations	181
7.6 Algorithmic Aspects	182
A. Convexity Conditions and Rank-one Connections	183
A.1 Convexity Conditions	183
A.2 Existence of Rank-one Connections	189
B. Elements of Crystallography	193
C. Notation	197
References	201
Index	211

Variational Methods for Crystalline Microstructure -
Analysis and Computation

Dolzmann, G.

2003, XI, 217 p., Softcover

ISBN: 978-3-540-00114-0
