Section I: The physics of accretion and ejection

Course 1. Accretion and Ejection-Related MHD

<i>by J. Heyvaerts</i>	3
1 Introduction	7
2 The MHD model	8
2.1 Following the motion	8
2.2 Conservation equations in general	8
2.3 Conservation of mass and charge	9
2.4 Conservation of momentum	9
2.5 Conservation of energy	10
2.6 Coupling to Maxwell's equations	12
3 Non relativistic MHD	12
3.1 Non relativistic MHD equations	13
3.2 Incompressible limit and Navier-Stokes equation	14
3.3 Magnetic pressure and tension	15
3.4 Alfvén speed	15
4 Special relativistic MHD	16
4.1 Four-vectors and tensors in minkowskian space	16
4.2 Equations of special relativistic MHD	18
5 Magneto hydrostatic equilibria	20
5.1 General properties of magneto hydrostatic equilibria	20
5.2 Axisymmetric MHD equilibria and Grad Shafranoff equation	21

6	Magnetic field evolution	23
6.1	The perfect MHD limit	23
6.2	Consequences and limits of the field freezing theorems	26
6.3	Field diffusion <i>versus</i> field advection	27
6.4	A simple model of joint advection and diffusion	28
6.5	Reconnection flows	30
7	The dynamo problem	34
7.1	Antidynamo theorems	35
7.2	Kinematic turbulent dynamos	36
8	Simple stationary flows	38
8.1	MHD Couette flow	38
8.2	Isotropic HD wind	39
9	Axisymmetric, rotating, stationary, perfect MHD winds and jets	43
9.1	Ferraro's isorotation law	43
9.2	Conservation of the polytropic entropy	45
9.3	Conservation of specific angular momentum	45
9.4	Alfvén radius and density	46
9.5	Conservation of specific energy	46
9.6	Transfield equation	48
9.7	Bernoulli dynamics alone	48
9.8	The Bernoulli-Transfield system	49
9.9	Alfvén regularity condition	50
9.10	Ellipticity or hyperbolicity of the Bernoulli-Transfield system	51
9.11	An analysis of forces in axisymmetric MHD winds and jets	52
10	Asymptotics of perfect MHD winds and jets	54
10.1	General results on the asymptotics of polytropic winds	54
10.2	Asymptotic transfield equation	55
10.3	Electric circuit in the asymptotic domain	57
10.4	Construction of explicit asymptotic solutions	59
11	Small motions	62
11.1	Linearized dynamical equations for small motions	62
11.2	Reduction to an equation for the Lagrangean displacement	63
11.3	Dispersion relation for MHD modes in an homogeneous medium	65
12	Stability	66
12.1	Perfect MHD potential energy	66
12.2	Change of potential energy and operator of small motions	67
12.3	Normal modes and potential energy	68

13 Some usual instabilities	69
13.1 Stability of a stratified compressible gas	69
13.2 Interchange instability of confined plasmas	70
13.3 Kink instability	73
14 Some instabilities in rotating fluids	76
14.1 Stability of the inviscid hydrodynamical Couette flow	76
14.2 Magnetorotational instability	79

Course 2. 2D Transonic Hydrodynamics in General Relativity

by V. Beskin 85

1 Introduction	87
2 Ideal hydrodynamics – some fundamental results	88
3 Axisymmetric stationary flow – nonrelativistic case	97
3.1 Basic equations	97
3.2 The stream equation	99
3.3 Examples	103
4 Axisymmetric stationary flow – general relativity	113
4.1 Basic equations	113
4.2 Examples	120
5 Conclusion	133
Appendix	134
A From Euler to Grad-Shafranov – the simplest way	134

Course 3. Physics Fundamentals of Luminous Accretion Disks Around Black Holes

by O.M. Blaes 137

1 Introduction	139
2 Shakura-Sunyaev based models	141
3 Spectral formation	147
4 The physics of angular momentum transport	157
5 The role of radiation magnetohydrodynamics	173

6 Conclusions	179
A The equations of radiation magnetohydrodynamics	180

Course 4. Accretion-Ejection Models of Astrophysical Jets

by R.E. Pudritz 187

1 Introduction	189
2 Observations and basic physics	190
2.1 Molecular outflows and jets in YSOs	190
2.2 YSO accretion disks: Links to jets	195
2.3 Magnetic fields: From molecular clouds to disks around YSOs . . .	196
2.4 The role of jets and accretion disks in star formation	197
2.5 Relativistic systems: Microquasars, quasars, and X-ray pulsars . .	198
2.6 Magnetized accretion disks: General physical processes	200
3 Theoretical models	202
3.1 Axisymmetric hydromagnetic winds: Conservation laws	202
3.2 MHD wind torques on disks: Jets as the mechanical manifestation of accretion power	206
3.3 Force-balance in jets; the mechanism of jet collimation	208
3.4 Accretion-ejection structures	211
3.5 Disk – magnetosphere coupling	214
4 Numerical simulations	215
4.1 2D simulations: Jets from stationary Keplerian disks	215
4.2 3D simulations: Self-regulatory stability of jets	223
4.3 Global simulations of accretion-ejection structures	226
5 Conclusion	227

Section II: High energy astrophysics

Course 5. Ultra High Energy Cosmic Rays

by V. Berezhinsky 233

1 Introduction	235
2 Extragalactic astrophysical origin of UHECR	237
2.1 Extragalactic acceleration sources	237
2.2 Energy losses and propagation	239
2.3 Uniform distribution of UHECR sources and GZK cutoff	241
2.4 The astrophysical AGN model for UHECR	243

3	Elementary particle solutions to UHECR problem	247
4	Conclusions	247

Course 6. Gamma-Ray Bursts

by F. Daigne 251

1	Introduction	253
2	Observations	255
2.1	Prompt emission	255
2.2	Afterglow	262
3	Theoretical scenario	271
3.1	Distance scale	271
3.2	Compact source – relativistic motion	272
3.3	Fireballs	274
3.4	A three-step scenario	279
4	Afterglow	280
4.1	The external shock	281
4.2	Radiative processes	283
4.3	Additional effects	285
5	Prompt emission	290
5.1	Internal shocks	290
5.2	Reverse shock	299
5.3	Results	302
5.4	Photosphere	303
6	Central engine	305
6.1	Mergers	306
6.2	Collapsars	307
6.3	MHD winds?	307
7	More than photons?	308
7.1	Ultra-high energy cosmic rays	308
7.2	High energy neutrinos	308
7.3	Gravitational waves	309
8	Conclusions	309

*Course 7. Cosmic Rays and Particle Acceleration
at Astrophysical Shocks*

by A. Achterberg 313

1	The birth of cosmic ray physics	315
2	Radio astronomy, magnetic fields and synchrotron radiation	317
3	Cosmic ray origin theories	319
4	Astrophysical particle acceleration	320
4.1	Shocks as accelerators	321
5	Basic principles of diffusive shock acceleration	323
6	Diffusion and acceleration time	331
7	The Box Model for shock acceleration	336
7.1	Maximum energy	339
7.2	Bohm diffusion	340
8	Outstanding issues: Theory	343
8.1	The question of injection	343
8.2	Stability: Precursor and shock stability	345
9	Inclination angle dependence and quasi-perpendicular shocks	346
9.1	Superluminal shocks	347
10	Relativistic shocks	349
11	Ultra-relativistic shocks	353
11.1	The case of upstream deflection	354
11.2	The case of upstream scattering	358
11.3	Initial boost	361
11.4	Cycle- and residence times and the maximum energy	363
12	Maximum energy: A cosmic conspiracy?	368
13	Gamma ray bursts and ultra-high-energy cosmic rays	373
13.1	Is there a connection between GRBs and UHECRs?	378
13.2	Acceleration by trans-relativistic waves/weak shocks	384
13.3	Acceleration of pulsar-wind material by the external shock	388
13.4	UHECR spectrum	391
13.5	Conclusion	394

Section III: Black holes and AGN's

Course 8. The Black Hole Environments

by M. Camenzind 405

1	Introduction	408
2	Black Holes and beyond	409
2.1	Astrophysically important aspects of Black Holes	409
2.2	Classes of compact objects	410
2.3	Accretion flows are not well understood	413
2.4	Direct detection of Black Holes	414
2.5	Present status	414
3	The black hole paradigm for galactic nuclei	415
3.1	Two aspects of the black hole paradigm	415
3.2	The Black Holes in nuclei of galaxies	418
3.3	The Fermion ball hypothesis	424
3.4	Messier 87 as a dead quasar	425
3.5	Cosmology for quasars	427
3.6	Cosmology with quasars	431
4	Gravity of compact objects	431
4.1	Relativistic gravity of rotating neutron stars	432
4.2	Rotating Black Holes	437
4.3	The source of gravity for Black Holes – or what is inside?	438
4.4	Particle motion in Kerr	439
4.5	The boundary layer around rotating Black Holes	441
4.6	The mass-formula for Black Holes	442
4.7	Spin evolution of Black Holes	444
4.8	Accretion beyond the innermost stable circular orbit	445
4.9	Magnetic energy production by rotating compact objects	452
4.10	Jets as collimated outflows from near the horizon	457
5	Conclusions and future prospects	458

Course 9. Accretion Around Active Galactic Nuclei

by B. Czerny 461

1	Introduction	463
1.1	Short history of the subject	464
1.2	Recent observational developments	465

2	General overview of AGN	467
2.1	Spatial resolution	468
2.2	Broad band spectra	470
2.3	Models of the principal components	471
2.4	Spectral features	473
2.5	The basic model of accretion flow pattern in bright AGN	475
2.6	The accretion flow in faint sources	479
3	Recent progress in stationary models of bright radio quiet objects	480
3.1	Hot plasma cooling – modeling the “primary” continuum	482
3.2	Hot plasma heating	483
3.3	Radiative transfer in X-ray irradiated medium in hydrostatic equilibrium	483
3.4	Electron conduction; disk evaporation/condensation	484
4	Recent progress in variability studies of bright radio quiet objects	485
4.1	General outline of variability studies	485
4.2	Time delays	485
4.3	Power spectra	486
4.4	Stationarity issue and new technics	487

Course 10. High Energy Emission of AGN

by A. Celotti 491

1	Introduction	493
2	Basic properties	494
2.1	The spectral energy distributions	496
3	Radio-quiet AGN	496
4	Radio-loud AGN	499
4.1	Blazar spectral energy distribution	500
4.2	The high energy component	500
4.3	Large scale jet emission	505
4.4	Jet properties	507
4.5	Cosmological backgrounds and intergalactic medium	508
5	Analogous systems?	509

6	Non-thermal radiation processes and relativistic beaming	510
6.1	Synchrotron emission	510
6.2	Inverse Compton emission	511
6.3	Pair production	513
6.4	Relativistic beaming	514

Section IV: Pre-main sequence objects

Course 11. Accretion Signatures in Young Stellar Objects

	<i>by N. Calvet</i>	<i>521</i>
1	Introduction	523
2	YSO	523
3	Formation mechanisms	526
4	Accretion luminosity and mass accretion rate	527
5	Magnetospheric accretion	527
5.1	Line formation in the magnetospheric flow	529
5.2	The accretion shock	531
6	Observations of disks in YSO	533
7	Accretion disks	534
8	FU Ori objects	535
9	Irradiated accretion disks	536
10	Effects of dust properties	540
11	SEDs of HAeBe	542
12	Winds as accretion diagnostics	543
13	Validity of the models	544
14	Summary	545

Course 12. Evolution of YSO Disks

	<i>by L. Hartmann</i>	<i>549</i>
1	Introduction	551

2	Viscous disk evolution	553
3	What is α (if any)?	560
4	Angular momentum loss by magnetically-coupled winds	563
5	Gravity	566
6	From protostars to T Tauri stars	568
7	Decay of T Tauri accretion	570
8	From T Tauri to debris disks	572
9	Gas dispersal	577

Course 13. X-Rays from YSOs: Desperately Seeking the Central Engine

by T. Montmerle 583

1	Background: YSOs and magnetic fields	585
1.1	Pre-main sequence evolution in a nutshell	585
1.2	X-rays as tracers of YSO magnetic activity	587
1.3	The “solar paradigm” and the solar-stellar connection	587
2	Challenging the solar paradigm	589
2.1	X-ray emission at high latitudes	589
2.2	Polar X-rays?	591
2.3	A new look at stellar dynamos	591
3	Starting the central engine: X-rays from protostars	592
4	Magnetic topology of YSOs: Confronting theory and observation	594
5	Conclusions	596

Section V: New instrumentation

Course 14. Pierre Auger Observatory: Status and Prospects

by C. Lachaud 601

1	Introduction	603
2	Main parameters of the ground array	604

3	Global performance of the ground array	605
3.1	Aperture	605
3.2	Energy resolution	605
3.3	Angular resolution	606
3.4	Composition analysis	606
4	Status and prospects	610

Course 15. Observations of the High Energy Gamma-Ray Universe

by C. Masterson 613

1	Experimental techniques in γ-ray astronomy	615
1.1	The stereo imaging technique	616
1.2	The H.E.S.S. telescope array	616
1.3	H.E.S.S. system performance	618
1.4	Satellite based γ -ray astrophysics	618
2	Astrophysics at VHE energies	619
2.1	Active Galactic Nuclei	619
2.2	Supernova remnants	620
2.3	Pulsars	620
2.4	Unidentified EGRET sources	621
2.5	Fundamental physics	621
3	Conclusions	621

Accretion Disks, Jets and High-Energy Phenomena in
Astrophysics

Les Houches Session LXXVIII, July 29 - August 23, 2002

Beskin, V.; Henri, G.; Menard, F.; Pelletier, G.; Dalibard,
J. (Eds.)

2003, XXVIII, 628 p., Hardcover

ISBN: 978-3-540-20171-7
