## *Course 1. Nonequilibrium Phase Transitions*

*by Z. Rácz* 1

<b>1 Introduction</b>	<b>3</b>
1.1 Nonequilibrium steady states . . . . .	4
1.2 Problems with usual thermodynamic concepts . . . . .	6
<b>2 Phase transitions far from equilibrium</b>	<b>8</b>
2.1 Differences from equilibrium – constructing models with NESS . .	8
2.2 Generation of long-range interactions – nonlocal dynamics . . . .	11
2.3 Generation of long-range interactions – dynamical anisotropies . .	13
2.4 Driven lattice gases, surface growth . . . . .	15
2.5 Flocking behavior . . . . .	16
<b>3 Where do the power-laws come from?</b>	<b>18</b>
3.1 Self-organized criticality (SOC) . . . . .	19
3.2 Absorbing state transitions and their connection to SOC . . . . .	21
<b>4 Distribution functions in nonequilibrium steady states</b>	<b>24</b>
4.1 Power laws and universality of nonequilibrium distributions . . . .	24
4.2 Picture gallery of scaling functions . . . . .	25
4.3 Upper critical dimension of the KPZ equation . . . . .	28
<b>5 Quantum phase transitions</b>	<b>30</b>
5.1 Spin chains with fluxes . . . . .	31
5.2 Effective interactions . . . . .	35
<b>6 Outlook</b>	<b>37</b>

*Course 2. Mechanical Aging and Non-Linear Rheology  
of Concentrated Colloidal Suspensions: Experimental  
Facts and Simple Models*

by A. Ajdari 41

<b>1 Introduction</b>	<b>43</b>
1.1 Colloidal glasses? . . . . .	43
1.2 Model and real colloids: Interactions . . . . .	44
1.3 Gels or glasses: Various kinds of soft solids? . . . . .	48
1.4 Wrapping up the introduction . . . . .	49
<b>2 Experimental facts 1: Soft solids that flow and age</b>	<b>50</b>
<b>3 A class of simple models</b>	<b>54</b>
3.1 A Maxwell model with one scalar internal variable . . . . .	54
3.2 Relation to other models in the literature . . . . .	55
3.3 Predictions . . . . .	57
3.4 Intermediary conclusion . . . . .	61
<b>4 Experimental facts 2: Soft solids that flow in a strange way</b>	<b>61</b>
4.1 Avalanches and “viscosity bifurcation” . . . . .	61
4.2 Parallel with flow induced transitions: Heterogeneous “banded” flows	62
4.3 Description within the simple class of models . . . . .	63
4.4 Intermediary conclusion . . . . .	66
<b>5 Criticism of the model and perspectives</b>	<b>67</b>
5.1 A classification of the phenomenologies . . . . .	67
5.2 Successes and failures of these models . . . . .	68
5.3 Better models: More variables? which collective physics? . . . . .	69
5.4 Back to facts . . . . .	71

*Course 3. Structural Relaxation and Rheology  
of Soft Condensed Matter*

by M.E. Cates 75

<b>1 Soft condensed matter</b>	<b>79</b>
<b>2 Rheology</b>	<b>81</b>
2.1 Stress tensor . . . . .	82
2.2 Statistical mechanics of stress . . . . .	83
2.3 Strain and strain rate . . . . .	85

<b>3</b>	<b>Linear rheology</b>	<b>87</b>
3.1	Step-strain response . . . . .	87
3.2	Oscillatory flow . . . . .	88
3.3	Steady shear . . . . .	89
3.4	Typical cases . . . . .	89
3.5	Linear creep measurements . . . . .	91
3.6	Simple forms for $G(t)$ . . . . .	91
<b>4</b>	<b>Linear viscoelasticity of polymers</b>	<b>92</b>
4.1	Entanglements . . . . .	92
4.2	Entropic elasticity . . . . .	93
4.3	Escape from the tube . . . . .	94
<b>5</b>	<b>Nonlinear rheology of polymers</b>	<b>95</b>
5.1	Typical experiments . . . . .	95
5.2	Nonlinear relaxation of polymers . . . . .	96
5.3	Constitutive equation . . . . .	98
5.4	Why are polymers tractable? . . . . .	99
<b>6</b>	<b>Dumbing down</b>	<b>99</b>
6.1	Dumbell model . . . . .	100
6.2	Scalarisation . . . . .	101
<b>7</b>	<b>What rheologists want</b>	<b>101</b>
<b>8</b>	<b>Rheology of soft glasses</b>	<b>102</b>
8.1	The effective temperature problem . . . . .	102
8.2	Phenomenology . . . . .	103
8.3	Bouchaud's trap model . . . . .	103
<b>9</b>	<b>The SGR model</b>	<b>105</b>
9.1	Features of the model . . . . .	106
9.2	Constitutive equation for SGR . . . . .	108
9.3	Tensorial SGR models . . . . .	109
<b>10</b>	<b>Rheological aging</b>	<b>111</b>
10.1	Step stress and step strain . . . . .	111
10.2	Oscillatory flows . . . . .	112
10.3	AOFOT? . . . . .	112
10.4	Weak long term memory . . . . .	113
10.5	The $G''$ problem . . . . .	114
10.6	Aging scenarios . . . . .	114
10.7	Nonlinear aging . . . . .	116
10.8	Ongoing work on aging and rheology . . . . .	118

<b>11 Shear thickening and jamming</b>	<b>118</b>
11.1 Nonmonotonic flow curves . . . . .	118
11.2 Shear thickening mechanisms . . . . .	119
11.3 Jamming SGR model . . . . .	121
<b>12 Rheological instability and oscillation</b>	<b>121</b>
12.1 A simpler model for rheo-instability . . . . .	123
<b>13 Rheochaos</b>	<b>124</b>
<b>14 More fundamental approaches</b>	<b>125</b>
<b>15 Conclusion</b>	<b>127</b>

## *Course 4. Granular Media: Some Ideas from Statistical Physics*

*by J.P. Bouchaud* 131

<b>1 Introduction</b>	<b>133</b>
1.1 Basic phenomenology . . . . .	133
1.2 Theoretical issues . . . . .	136
<b>2 The scalar model I: Discrete version</b>	<b>140</b>
2.1 Definition and motivation . . . . .	140
2.2 Stress distribution and the exponential tail . . . . .	141
2.3 The “critical” case . . . . .	143
<b>3 The scalar model II: Continuous limit and perturbation theory</b>	<b>144</b>
3.1 Continuous limit of the scalar model . . . . .	144
3.2 Calculation of the averaged response and correlation functions . . .	147
3.3 Further results: The un-averaged response function . . . . .	153
3.4 The scalar model with bias: Edwards’ picture of arches . . . . .	154
<b>4 Static indeterminacy; elasticity and isostaticity</b>	<b>155</b>
4.1 Elasticity and response functions . . . . .	155
4.2 Indeterminacy at the grain level and isostaticity . . . . .	157
4.3 Numerical simulations and Edwards’ assumption . . . . .	158
<b>5 A stress-only approach to granular media</b>	<b>160</b>
5.1 A vectorial q-model . . . . .	160
5.2 A constitutive relation between stress components . . . . .	162
5.3 Some simple situations . . . . .	163
5.4 Symmetries and constitutive relations . . . . .	164
5.5 Boundary conditions and “fragility” . . . . .	166

<b>6</b>	<b>Experimental and numerical determination of the stress response function</b>	<b>167</b>
<b>7</b>	<b>Force chains scattering I: Weak disorder limit</b>	<b>168</b>
7.1	A stochastic wave equation . . . . .	168
7.2	Calculation of the averaged response function . . . . .	171
7.3	Generalized wave equations . . . . .	174
<b>8</b>	<b>Force chains scattering II: Strong disorder limit</b>	<b>177</b>
8.1	Introduction and numerical results . . . . .	177
8.2	A Boltzmann description of force chain splitting . . . . .	178
8.3	The role of chain merging . . . . .	181
<b>9</b>	<b>Statics of granular materials: Concluding remarks and open questions</b>	<b>182</b>
<b>10</b>	<b>Glassy dynamics in granular media: A brief survey</b>	<b>184</b>
10.1	Slow compaction . . . . .	184
10.2	Self-inhibitory dynamics and dynamical heterogeneities . . . . .	186
10.3	Granular dynamics and the trap model . . . . .	190

*Course 5. Supercooled Liquids, the Glass Transition, and Computer Simulations*

*by W. Kob* 199

<b>1</b>	<b>Introduction</b>	<b>201</b>
<b>2</b>	<b>Supercooled liquids and the glass transition: Important facts and concepts</b>	<b>202</b>
<b>3</b>	<b>The mode-coupling theory of the glass transition</b>	<b>217</b>
3.1	The Mori-Zwanzig formalism . . . . .	217
3.2	Application of the Mori-Zwanzig formalism to glass-forming systems . . . . .	220
<b>4</b>	<b>Computer simulations of glass-forming systems</b>	<b>230</b>
<b>5</b>	<b>The relaxation dynamics of glass-forming liquids as investigated by computer simulations</b>	<b>239</b>
5.1	Static and dynamic properties of a simple liquid with Newtonian dynamics . . . . .	239

5.2	The relaxation dynamics of a simple liquid with stochastic dynamics . . . . .	250
5.3	Static and dynamic properties of a network forming liquid . . . . .	255
<b>6</b>	<b>Summary and perspectives</b>	<b>261</b>
 <i>Course 6. Glasses, Replicas and all that</i>		
	<i>by G. Parisi</i>	<i>271</i>
<b>1</b>	<b>Introduction</b>	<b>275</b>
1.1	General considerations . . . . .	275
1.2	Glassiness, metastability and hysteresis . . . . .	276
1.3	The organization of these lectures . . . . .	280
<b>2</b>	<b>The random energy model</b>	<b>281</b>
2.1	The definition of the model . . . . .	281
2.2	Equilibrium properties of the model . . . . .	282
2.3	The properties of the low temperature phase . . . . .	286
2.4	A careful analysis of the high temperature phase . . . . .	290
2.5	The replica method . . . . .	292
2.6	Dynamical properties of the model . . . . .	294
<b>3</b>	<b>Models with partially correlated energy</b>	<b>295</b>
3.1	The definition of the models . . . . .	295
3.2	The replica solution . . . . .	296
3.3	The physical interpretation . . . . .	300
3.4	The two susceptibilities . . . . .	305
3.5	The cavity method . . . . .	307
<b>4</b>	<b>Complexity</b>	<b>310</b>
4.1	The basic definitions . . . . .	312
4.2	Computing the complexity . . . . .	314
4.3	Complexity and replicas . . . . .	319
4.4	A summary of the results . . . . .	324
4.5	Some consideration on the free energy landscape and on the dynamics . . . . .	325
4.6	Small fluctuations . . . . .	328
<b>5</b>	<b>Structural relations</b>	<b>330</b>
5.1	Stochastic stability . . . . .	330
5.2	A simple consequence of stochastic stability . . . . .	333
5.3	Fluctuation dissipation relations . . . . .	334
<b>6</b>	<b>A short introduction to glasses</b>	<b>335</b>

<b>7</b>	<b>The replica approach to structural glasses: General formalism</b>	<b>337</b>
7.1	The partition function . . . . .	338
7.2	Molecular bound states . . . . .	339
7.3	The small cage expansion . . . . .	339
<b>8</b>	<b>The replica approach to structural glasses: Some results</b>	<b>346</b>
8.1	Three approximation schemes . . . . .	346
8.2	Critical temperature and effective temperature . . . . .	347
8.3	Cage size . . . . .	348
8.4	Free energy, specific heat and configurational entropy . . . . .	349
8.5	The missing dynamical transition . . . . .	350
8.6	Lenhard-Jones binary mixtures . . . . .	351
<b>9</b>	<b>Discussion and perspectives</b>	<b>354</b>

## *Course 7. Dynamics of Glassy Systems*

*by L.F. Cugliandolo* 367

<b>1</b>	<b>Introduction</b>	<b>371</b>
<b>2</b>	<b>Some physical systems out of equilibrium</b>	<b>374</b>
2.1	Domain growth . . . . .	374
2.2	Glasses . . . . .	377
2.3	Spin-glasses . . . . .	380
2.4	Quantum fluctuations . . . . .	382
2.5	Rheology and granular matter . . . . .	382
2.6	Elastic manifolds in random potentials . . . . .	384
2.7	Aging . . . . .	384
2.8	Summary . . . . .	387
<b>3</b>	<b>Theoretical approach</b>	<b>388</b>
<b>4</b>	<b>Systems in contact with environments</b>	<b>390</b>
4.1	Modeling the coupled system . . . . .	391
<b>5</b>	<b>Observables and averages</b>	<b>395</b>
5.1	Classical systems . . . . .	395
5.2	Quantum problems . . . . .	398
5.3	Average over disorder . . . . .	399
<b>6</b>	<b>Time dependent probability distributions</b>	<b>399</b>
6.1	The Fokker-Planck and Kramers equations . . . . .	399
6.2	Approach to equilibrium . . . . .	400
6.3	Equilibrium dynamics . . . . .	401

<b>7</b>	<b>The fluctuation – dissipation theorem (FDT)</b>	<b>403</b>
7.1	Static FDT . . . . .	403
7.2	Dynamic FDT . . . . .	404
7.3	Quantum FDT . . . . .	404
7.4	Examples . . . . .	405
<b>8</b>	<b>Dynamic generating functionals</b>	<b>407</b>
8.1	Classical models . . . . .	407
8.2	Supersymmetry (SUSY) . . . . .	409
8.3	Connection with the replica formalism . . . . .	411
8.4	Quantum models . . . . .	411
8.5	Average over disorder . . . . .	415
<b>9</b>	<b>Dynamic equations</b>	<b>416</b>
9.1	A useful derivation for fully-connected models . . . . .	416
9.2	Beyond fully-connected models . . . . .	426
9.3	Field equations . . . . .	430
9.4	The thermodynamic limit and time-scales . . . . .	431
9.5	Single spin equation . . . . .	431
<b>10</b>	<b>Diagrammatic techniques</b>	<b>432</b>
10.1	Perturbative solution . . . . .	432
10.2	The mode coupling approximation (MCA) . . . . .	434
10.3	MCA and disordered models . . . . .	435
10.4	MCA for super-cooled liquids and glasses . . . . .	438
<b>11</b>	<b>Glassy dynamics: Generic results</b>	<b>439</b>
11.1	The weak-ergodicity breaking scenario . . . . .	439
11.2	The weak long-term memory scenario . . . . .	441
11.3	Slow time-reparametrization invariant dynamics . . . . .	442
11.4	Correlation scales . . . . .	443
11.5	Modifications of FDT . . . . .	449
<b>12</b>	<b>Solution to mean-field models</b>	<b>455</b>
12.1	Numerical solution . . . . .	455
12.2	Solution at high temperatures . . . . .	456
12.3	Solution at low- $T$ . . . . .	458
<b>13</b>	<b>Modifications of FDT in physical systems</b>	<b>469</b>
13.1	Domain growth . . . . .	469
13.2	Structural glasses . . . . .	471
13.3	Spin-glasses . . . . .	472
13.4	Rheology . . . . .	473
13.5	Vibrated models and granular matter . . . . .	474
13.6	Driven vortex systems . . . . .	474
13.7	Quantum fluctuations . . . . .	475
13.8	Systems of finite size: Preasymptotic behavior . . . . .	475

13.9 Critical dynamics . . . . .	475
13.10 Connection with equilibrium . . . . .	476
<b>14 Effective temperatures</b>	<b>477</b>
14.1 Thermodynamical tests . . . . .	479
14.2 Temperature fixing by SUSY breaking . . . . .	485
14.3 Fictive temperatures . . . . .	485
14.4 Nonequilibrium thermodynamics . . . . .	486
14.5 Statistical mechanics . . . . .	486
<b>15 Metastable states</b>	<b>487</b>
15.1 Equilibrium . . . . .	488
15.2 Static TAP approach . . . . .	490
15.3 The TAP equations . . . . .	492
15.4 Stability of, and barriers between, the TAP solutions . . . . .	493
15.5 Index dependent complexity . . . . .	495
15.6 Weighted sums over TAP solutions . . . . .	495
15.7 Accessing metastable states with replicas . . . . .	497
15.8 Dynamics and quantum systems . . . . .	498
<b>16 Conclusions</b>	<b>499</b>
<b>17 Perspectives</b>	<b>505</b>
<b>A Generalized Langevin equations</b>	<b>506</b>
<b>B The Kubo formula</b>	<b>509</b>
<b>C The response in a Langevin process</b>	<b>510</b>
<b>D Grassmann variables and supersymmetry</b>	<b>510</b>
<b>E Integrals in the aging regime</b>	<b>512</b>

*Course 8. Equilibrium States and Dynamics  
of Equilibration: General Issues and Open Questions*

*by D.S. Fisher* 523

<b>1 Introduction</b>	<b>525</b>
<b>2 Equilibrium states</b>	<b>526</b>
2.1 Infinite system ground states . . . . .	527
2.2 Positive temperature states . . . . .	532
2.3 Number of equilibrium states? . . . . .	533

<b>3</b>	<b>Dynamics and barriers</b>	<b>535</b>
3.1	Domain coarsening . . . . .	536
3.2	Dynamics and local equilibrium . . . . .	539
<b>4</b>	<b>Spin glasses</b>	<b>541</b>
4.1	Scaling scenario . . . . .	543
4.2	Observation of many states? . . . . .	547
<b>5</b>	<b>Non-random systems: True glasses</b>	<b>549</b>

### *Course 9. Experimental Analysis of Aging*

*by S. Ciliberto* 555

<b>1</b>	<b>Introduction</b>	<b>557</b>
<b>2</b>	<b>Aging, memory and rejuvenation</b>	<b>558</b>
2.1	Aging range: A simple quench experiment . . . . .	558
2.2	Memory and rejuvenation . . . . .	562
2.3	Discussion on the memory effect . . . . .	573
<b>3</b>	<b>Effective temperature of an aging material</b>	<b>575</b>
3.1	The X-ray scattering experiment . . . . .	577
3.2	Supercooled liquid experiment . . . . .	579
3.3	Gel electric properties . . . . .	580
3.4	Polycarbonate dielectric properties . . . . .	586
3.5	Rheological measurements . . . . .	595
3.6	Discussion and conclusions on the effective temperature . . . . .	600
<b>4</b>	<b>General conclusions</b>	<b>601</b>

### *Course 10. Fluctuation Dissipation Relation in a Non-Stationary System: Experimental Investigation in a Spin Glass*

*by M. Ocio and D. Hérisson* 605

<b>1</b>	<b>Introduction</b>	<b>607</b>
<b>2</b>	<b>Theoretical background</b>	<b>608</b>
<b>3</b>	<b>Experimental</b>	<b>609</b>
3.1	Measurement of magnetic fluctuations . . . . .	609
3.2	Principle of measurement: An absolute thermometer . . . . .	611
3.3	Experimental results . . . . .	614

<b>4 Discussion</b>	<b>616</b>
<b>5 Conclusion</b>	<b>620</b>

*Course 11. Non-Equilibrium Dynamics and Aging  
in the Electron Glass*

*by Z. Ovadyahu* 623

<b>1 Introduction</b>	<b>625</b>
<b>2 The characteristics of the electron-glass</b>	<b>626</b>
2.1 The field effect technique . . . . .	626
2.2 Preliminary results . . . . .	627
2.3 Basic features of the electron-glass . . . . .	631
<b>3 The role of the electron–electron interaction</b>	<b>637</b>
3.1 Experimental evidence for the role of interactions . . . . .	637
3.2 The Coulomb gap . . . . .	643
3.3 Theoretical treatment of relaxation in the presence of interactions	644
<b>4 Concluding remarks</b>	<b>646</b>

*Course 12. Proteins: Structural, Thermodynamic  
and Kinetic Aspects*

*by A.V. Finkelstein* 649

<b>1 Introduction</b>	<b>651</b>
<b>2 Overview of protein architectures and discussion of physical background of their natural selection</b>	<b>651</b>
2.1 Protein structures . . . . .	651
2.2 Physical selection of protein structures . . . . .	656
<b>3 Thermodynamic aspects of protein folding</b>	<b>670</b>
3.1 Reversible denaturation of protein structures . . . . .	670
3.2 What do denatured proteins look like? . . . . .	673
3.3 Why denaturation of a globular protein is the first-order phase transition . . . . .	677
3.4 “Gap” in energy spectrum: The main characteristic that distinguishes protein chains from random polymers . . . . .	681

<b>4</b>	<b>Kinetic aspects of protein folding</b>	<b>685</b>
4.1	Protein folding <i>in vivo</i> . . . . .	685
4.2	Protein folding <i>in vitro</i> (in the test-tube) . . . . .	685
4.3	Theory of protein folding rates and solution of the Levinthal paradox . . . . .	692

*Course 13. Self-Organized Criticality  
in Granular Superconductors*

*by S.L. Ginzburg and N.E. Savitskaya* 705

<b>1</b>	<b>Introduction</b>	<b>707</b>
<b>2</b>	<b>1D multijunction SQUID with random location of the junctions</b>	<b>708</b>
<b>3</b>	<b>Single-junction SQUID</b>	<b>710</b>
<b>4</b>	<b>1D sandpile model</b>	<b>712</b>
<b>5</b>	<b>The simplified model of 1D multijunction SQUID</b>	<b>713</b>
<b>6</b>	<b>Computer simulation results</b>	<b>715</b>
<b>7</b>	<b>Conclusions</b>	<b>717</b>

*Course 14. Hiking through Glassy Phases:  
Physics beyond Aging*

*by L. Berthier, V. Viasnoff, O. White, V. Orlyanchik  
and F. Krzakala* 719

<b>1</b>	<b>Introduction</b>	<b>721</b>
<b>2</b>	<b>Experimental facts</b>	<b>723</b>
2.1	Rejuvenation . . . . .	723
2.2	Overaging and underaging . . . . .	724
2.3	Memory effect of the first kind, or “Kovacs effect” . . . . .	726
2.4	Memory effect of the second kind . . . . .	726
2.5	Need for a generic and robust phenomenology . . . . .	726
<b>3</b>	<b>Two mean-field theoretical approaches</b>	<b>727</b>
3.1	Trap and multi-trap models . . . . .	727
3.2	Infinite-range models . . . . .	728

<b>4 Spatial approaches</b>	<b>728</b>
4.1 Domain growth . . . . .	728
4.2 A minimal phenomenology . . . . .	729
4.3 Back to experiments . . . . .	731
4.4 Droplets and chaos in spin glasses . . . . .	732
4.5 Surfing on a critical line . . . . .	734
<b>5 Two experiments</b>	<b>736</b>
5.1 Anderson insulator . . . . .	736
5.2 Colloidal suspension . . . . .	737
<b>6 Conclusion</b>	<b>739</b>

*Course 15. Kinetically Constrained Models and Driven Systems with Slow Dynamics*

*by H.S. Bond, M. Clincy and S. Whitlam* 743

<b>1 Introduction and overview</b>	<b>745</b>
<b>2 The Fredrickson-Andersen model</b>	<b>747</b>
<b>3 The Kob-Andersen model</b>	<b>749</b>
<b>4 The <i>ABC</i> model</b>	<b>751</b>
<b>5 Conclusions and outlook</b>	<b>753</b>

*Course 16. Dynamic Transitions in Thermal and Athermal Systems*

*by C.B. Holmes, J.H. Snoeijer and Th. Voigtmann* 755

<b>1 Introduction</b>	<b>757</b>
<b>2 Universal behavior of the force distribution?</b>	<b>758</b>
<b>3 Colloidal glasses and gels</b>	<b>760</b>
<b>4 Jamming transitions</b>	<b>763</b>
<b>5 Conclusion</b>	<b>764</b>

<i>Previous Sessions</i>	<i>767</i>

Slow Relaxations and Nonequilibrium Dynamics in  
Condensed Matter

Les Houches Session LXXVII, 1-26 July, 2002

Barrat, J.-L.; Feigelman, M.V.; Kurchan, J.; Dalibard, J.  
(Eds.)

2003, XXXIII, 769 p., Hardcover
