

Table of Contents

I	The UNSI Project	1
1	Summary	1
2	Introduction	1
3	Technical project description	3
3.1	Research approach and methodology	3
3.2	Description of tasks	4
	<i>Task 1.1: Test case definition and identification</i>	5
	<i>Task 1.2: Web server, data base, file server and data standard</i>	5
	<i>Task 2: Measurements for high subsonic, steady/unsteady, two-dimensional airfoil and three-dimensional wing</i>	5
	<i>Task 3.1: Flow physics (turbulence) modelling for unsteady flows</i>	6
	<i>Task 3.2: Mesh movement and adaptation</i>	6
	<i>Task 3.3: Grids for unsteady analysis around aircraft and aircraft components</i>	6
	<i>Task 3.4: Calibration of CFD codes for steady/unsteady two-dimensional flows</i>	7
	<i>Task 3.5: Calibration of CFD codes for steady/unsteady three-dimensional flow on structured and unstructured meshes</i> ..	7
	<i>Task 4: Coupling strategies / coupling of CFD and CSM (Euler/NS)</i>	7
	<i>Task 5.1: Time linearisation strategies and improved linear theory predictions</i>	8
	<i>Task 5.2: Calibration of (static) aeroelasticity methods, i.e. for steady flow field behaviour</i>	8
	<i>Task 5.3: Calibration of aeroelasticity methods for subsonic flow exhibiting separation</i>	8
	<i>Task 5.4: Calibration of aeroelasticity methods for a transonic flow case including flutter phenomena</i>	9
	<i>Task 6: Project management and exploitation</i>	9
3.3	Task-per-partner matrix	9
3.4	List of partners and addresses	10
4	Conclusion	12
5	The UNSI Web site	12
II	Technical, partner-related reports containing method descriptions and concise presentation of important results	13
1	<i>Alenia: Coupled fluid/structure system</i>	13
2	<i>BAe: Effective schemes for CFD-CSM coupling</i>	21
3	<i>CASA: Efficient and robust techniques for time accurate computation and grid deformation in strongly coupled aeroelasticity</i>	31
4	<i>EADS-M (Dasa-M): Static and dynamic aeroelastic simulations in transonic and supersonic flow</i>	39
5	<i>Dassault: Methods and results</i>	47
6	<i>DERA: Adaptation for unsteady viscous flows</i>	55
7	<i>DLR: Simulation of steady and unsteady flows about airfoils</i>	65
8	<i>FFA: Flow physics modelling and numerical issues for unsteady and aeroelastic computations</i>	73

9	<i>IMFT</i> : Turbulence modelling of unsteady flows with a pronounced periodic character	87
10	<i>IRPHE</i> : Experimental methods for subsonic flow measurements	97
11	<i>NUMECA</i> : All-hexahedra unstructured flow solver for external aerodynamics with application to aeroelasticity	105
12	<i>ONERA</i> : Static and dynamic aeroelastic computations using advanced 3D-unsteady aerodynamic solvers	117
13	<i>QMW</i> : Numerical modelling of fluid-structure interaction problems	125
14	<i>SAAB</i> : Summary of Saab's work in UNSI	133
15	<i>TUB</i> : Methods used and highlight results achieved in UNSI	139
III	Summary of work carried out in the main tasks of the UNSI project	145
1	Flow physics modelling	145
2	Data base for steady and unsteady, 2D and 3D flow	155
3	Grid deformation and adaptation	165
4	CFD validation results	173
5	Coupling of structure and fluids	177
6	Static aeroelastic coupling	191
7	Dynamic aeroelastic coupling – flutter	205
8	Assessment of strategies for correcting linear unsteady aerodynamics using CFD or test results	209
IV	Application-oriented synthesis of work	225
1	NACA0012 airfoil, 2D steady and unsteady	225
2	18% arc airfoil	237
3	NACA0012 wing, steady and unsteady	243
4	NACA0012 wing, DNS results	251
5	AGARD NACA64A010, cases: CT6 and SSC	261
6	AGARD LANN wing, cases: CT5 and CT9	269
7	AMP wing	279
8	MDO wing/aircraft steady	289
9	MDO wing: Common dynamic test case	305
10	AGARD 445.6	319
11	Delta wing (in pitch with flap)	329
12	X31 wing – static and dynamic aeroelasticity	333
13	NACA64A010 2DOF airfoil	343
14	Flexible sail	351
V	Conclusion and lessons learnt	361
1	General comments	361
2	Lessons learnt	361
3	Conclusion and recommendation	362
VI	References	363

Progress in Computational Flow-Structure Interaction
