

Contents

1. Introduction	1
1.1 Multivariable Systems and Decoupling Control	2
1.2 Disturbance Decoupling	5
1.3 Organization of the Book	8
2. Representations of Linear Dynamic Systems	11
2.1 Linear Dynamical Systems	11
2.2 Polynomial Matrices	15
2.2.1 Unimodular Matrices and Elementary Operations	16
2.2.2 Degree and Division	16
2.2.3 Stability of Polynomial Matrices	22
2.2.4 Hermite and Smith Forms	24
2.2.5 Common Divisor and Coprimeness	27
2.3 Rational Matrices and Polynomial Matrix Fractions	31
2.3.1 Coprime Polynomial Matrix Fractions	33
2.3.2 Smith-McMillan Form	36
2.3.3 Poles and Zeros	39
2.3.4 Proper Rational Matrices and Realization	41
2.4 Model Reduction	46
2.4.1 Recursive Least Square Reduction	46
2.4.2 Stable Model Reduction	51
2.5 Conversions between Continuous and Discrete Systems	57
2.5.1 Popular Rules	59
2.5.2 A Frequency Response Fitting Approach	61
2.6 Notes and References	64
3. Stability and Robustness of Feedback Systems	65
3.1 Internal Stability	65
3.1.1 Stability Criteria	65
3.1.2 Proof of Theorem 3.1.2	71
3.2 Unity Feedback Systems	84
3.3 Plant Uncertainty and Stability Robustness	99
3.3.1 Unstructured Uncertainty	100
3.3.2 Structured Uncertainties	102
3.3.3 Quantitative Robust Stability Analysis	108
3.4 Notes and References	113

4. State Space Approach	115
4.1 Static Decoupling	116
4.2 Dynamic Decoupling	118
4.3 Poles and Zeros of Decoupled Systems	125
4.4 Notes and References	128
5. Polynomial Matrix Approach	129
5.1 Problem Formulation and Preliminaries	129
5.2 Diagonally Decoupling for Square Plants	133
5.2.1 Solution	134
5.2.2 An Alternative Condition	141
5.3 Block Decoupling for General Plants	149
5.3.1 Solvability	151
5.3.2 Controller Parameterization	155
5.3.3 Achievable Performance after Decoupling	157
5.4 A Unified Solution	162
5.4.1 Skew Primeness in \mathbb{C}^+	164
5.4.2 Least Block Multiples	167
5.4.3 Solvability Conditions	172
5.4.4 Characterization of Solutions	178
5.5 Notes and References	184
6. Transfer Matrix Approach	187
6.1 Plants with Time Delay	187
6.2 Decoupling	190
6.3 Achievable Performance	195
6.4 Design Procedure	201
6.5 Stability and Robustness Analysis	206
6.6 Why PID Is Not Adequate	210
6.7 More Simulation	224
6.8 Conclusions	234
6.9 Notes and References	235
7. Delay Systems	237
7.1 The IMC Scheme	237
7.1.1 Analysis	241
7.1.2 Design	246
7.1.3 Simulation	249
7.2 The Smith Scheme	256
7.2.1 The Structure	256
7.2.2 Design	257
7.2.3 Stability Analysis	258
7.2.4 Simulation	260
7.3 Notes and References	265

8. Near-Decoupling	267
8.1 Motivation for the Concept of Near-Decoupling	267
8.2 Near-Decoupling for Unperturbed Systems: State Feedback	269
8.3 Robust Near-Decoupling: State Feedback	276
8.4 Near-Decoupling: Dynamic Output Feedback	278
8.5 Robust Near-Decoupling: Dynamic Output Feedback	282
8.6 A Numerical Example	285
8.7 Concluding Remarks	288
8.8 Notes and References	292
9. Dynamic Disturbance Decoupling	293
9.1 Measurable Disturbance: Feedforward Control	293
9.1.1 Solvability	295
9.1.2 Synthesis	300
9.2 Unmeasurable Disturbances: Disturbance Observers	305
9.2.1 Disturbance Observers	306
9.2.2 Analysis	310
9.2.3 Periodic Disturbances	312
9.2.4 Simulation	315
9.2.5 Extension to the MIMO Case	318
9.3 Notes and References	323
10. Asymptotic Disturbance Decoupling	327
10.1 General Disturbances: Internal Model Principle	327
10.1.1 Preliminaries	329
10.1.2 Solvability	331
10.1.3 Algorithms	335
10.2 Periodic Disturbances: Virtual Feedforward Control	340
10.2.1 The Scheme	340
10.2.2 Implementation and Simulation	344
10.2.3 Extension to the MIMO Case	353
10.3 Notes and References	355
References	357
Index	365
