
Contents

1 Plant ecology at high elevations	1
The concept of limitation	1
A regional and historical account	3
The challenge of alpine plant research	7
2 The alpine life zone	9
Altitudinal boundaries	9
Global alpine land area	12
Alpine plant diversity	13
Origin of alpine floras	16
Alpine growth forms	18
3 Alpine climate	21
Which alpine climate?	21
Common features of alpine climates	21
Regional features of alpine climates	26
4 The climate plants experience	31
Interactions of relief, wind and sun	31
How alpine plants influence their climate	38
The geographic variation of alpine climate	45
5 Life under snow: protection and limitation	47
Temperatures under snow	47
Solar radiation under snow	48
Gas concentrations under snow	52
Plant responses to snowpack	54
6 Alpine soils	63
Physics of alpine soil formation	63
The organic compound	70
The interaction of organic and inorganic compounds	74
7 Alpine treelines	77
About trees and lines	77
Current altitudinal positions of climatic treelines	78

Treeline-climate relationships	80
Intrazonal variations and pantropical plateauing of alpine treelines	86
Treelines in the past	87
Attempts at a functional explanation of treelines	88
A hypothesis for treeline formation	95
Growth trends near treelines	97
Evidence for sink limitation	99
8 Climatic stress	101
Survival of low temperature extremes	102
Avoidance and tolerance of low temperature extremes	106
Heat stress in alpine plants	111
Ultraviolet radiation – a stress factor?	114
9 Water relations	121
Ecosystem water balance	121
Soil moisture at high altitudes	126
Plant water relations – a brief review of principles	133
Water relations of alpine plants	134
Desiccation stress	143
Water relations of special plant types	145
10 Mineral nutrition	149
Soil nutrients	150
The nutrient status of alpine plants	152
Nutrient cycling and nutrient budgets	155
Nitrogen fixation	160
Mycorrhiza	163
Responses of vegetation to variable nutrient supply	165
11 Uptake and loss of carbon	171
Photosynthetic capacity of alpine plants	171
Photosynthetic responses to the environment	180
Daily carbon gain of leaves	186
The seasonal carbon gain of leaves	186
C4 and CAM photosynthesis at high altitudes	189
Tissue respiration of alpine plants	190
Ecosystem carbon balance	196
12 Carbon investments	201
Non-structural carbohydrates	201
Lipids and energy content	209
Carbon costs of leaves and roots	211
Whole plant carbon allocation	214
13 Growth dynamics and phenology	221
Seasonal growth	221

Diurnal leaf extension	226
Rates of plant dry matter accumulation	228
Functional duration of leaves and roots	230
14 Cell division and tissue formation	235
Cell size and plant size	235
Mitosis and the cell cycle	237
From meristem activity to growth control	243
15 Plant biomass production	247
The structure of alpine plant canopies	247
Primary productivity of alpine vegetation	248
Plant dry matter pools	253
Biomass losses through herbivores	257
16 Plant reproduction	259
Flowering and pollination	259
Seed development and seed size	266
Germination	271
Alpine seed banks and natural recruitment	274
Clonal propagation	279
Alpine plant age	289
Community processes	290
17 Global change at high elevation	291
Alpine land use	291
The impact of altered atmospheric chemistry	294
Climatic change and alpine ecosystems	296
References (with chapter annotation)	299
Index	335
Taxonomic index (genera)	335
Geographical index	339
Subject index	341
Color plates	345
Plant life forms	346
The alpine life zone	347
Environmental stress	348
The human dimension	349

Alpine Plant Life

Functional Plant Ecology of High Mountain Ecosystems

Körner, C.

2003, XI, 349 p., Hardcover

ISBN: 978-3-540-00347-2
