

# Contents

<b>1. Introduction</b>	1
<b>2. Acoustic Spectroscopy of Ideal Solutions</b>	7
2.1 Density	8
2.2 Viscosity	8
2.3 Ultrasound Velocity, Compressibility, and Heat Capacity	12
2.4 Ultrasonic Absorption	14
<b>3. Phase-Separating Solutions</b>	23
3.1 Hydrogen Bonds in Solutions with Lower Phase-Separation Critical Point	23
3.2 Phase Diagrams of Phase-Separating Solutions. Order Parameter	25
3.3 Phase Diagrams of Binary Solutions with One Critical Point	27
3.4 Binary and Ternary Solutions with Closed Phase-Separation Region	27
<b>4. Dynamics of States Close to Critical</b>	37
4.1 Low Frequency Acoustic Spectroscopy of Weakly Absorbing Liquids	37
4.2 Acoustic Spectroscopy of Critical Solutions with Low Sound Absorption	39
4.3 Acoustic Perturbation and Correlation Radius of Fluctuations in the Vicinity of a Critical Point	43
4.4 Chemical Reactions in Near-Critical States	45
4.5 Kinetics of Mono- and Bimolecular Reactions Close to a Phase-Separation Critical Point	46
<b>5. Physics of Solutions with Double Critical Point</b>	53
5.1 Theory of Solutions with Double Critical Point	54
5.2 Rayleigh Scattering of Light	55
5.3 Dynamics of Near-Critical States of Solutions with a DCP	62
5.4 Shear Viscosity	63
5.5 Sound Propagation	67

<b>6. Micellization as a Phase Transition</b>	71
6.1 Conceptual Experiments	71
6.2 Electronic Structure of Hydrocarbon Chains of Molecules	75
6.3 Fluctuon Model of Micellization	77
6.4 Green Function Method	80
6.5 Huckel's Method of Molecular Orbitals	81
6.6 Critical Micellization Concentration	84
6.7 Micellization as a Phase Transition of Finite Type	88
6.8 Phase Transitions at Micellization in Solutions of Ionic Molecules	90
6.9 Kinetics of Micellar and Pre-micellar Associations	93
6.10 Micellization Under Intensification of Molecular Mass Transfer	101
6.11 Micellization in the Electric Field of Charged Admixtures	105
<b>7. Fluctuation Mechanism of Forced Spinodal Decomposition</b>	113
7.1 Spinodal Decomposition as a Model for Microemulsion Formation	113
7.2 Non-equilibrium States in Phase-Separating Binary Liquids and External Perturbations	119
7.2.1 Variable Electric Field	121
7.2.2 Ultrasound	122
7.2.3 Thermal Action	122
7.2.4 Optothermal Influence	123
7.2.5 Noise Field	123
7.2.6 Turbulence	124
7.2.7 Shear Flow	124
7.2.8 Centrifugal Forces	125
7.2.9 Stirring	126
7.3 External Perturbation and Spinodal Decomposition	128
7.3.1 Heating of a System Without Stirring	129
7.3.2 Heating of a System by Stirring	131
7.4 Statistical Account of an External Stirring Field	133
<b>8. Weak Stirring and Absolute Instability Phenomena</b>	139
8.1 Singularity in the Heat Capacity in Forced Spinodal Decomposition	139
8.2 Extending the Region of Absolute Instability	142
8.3 Initial Stage Kinetics of Forced Spinodal Decomposition	145
<b>9. Microheterophase Relaxation State</b>	147
9.1 Relaxation State Near the Boundary of Absolute Instability Under Weak Perturbation	147

9.2	Surface Tension Energy and Heat Absorption Effect . . . . .	150
9.3	Thermal Relaxation Effects in the Cellular Structure . . . . .	152
<b>10.</b>	<b>Transition from Emulsion to Microemulsion . . . . .</b>	<b>155</b>
10.1	Microemulsion Structure . . . . .	155
10.2	Polychronal Relaxation Processes and Dispersion on the Interface . . . . .	158
10.3	Stable Microheterophase State on the Interface of Weakly Dissolved Liquids . . . . .	161
10.4	Conclusion . . . . .	166
<b>References</b>	. . . . .	<b>169</b>

Phase Separation in Soft Matter Physics

Micellar Solutions, Microemulsions, Critical Phenomena

Khabibullaev, P.K.; Saidov, A.

2003, IX, 186 p., Hardcover

ISBN: 978-3-540-43890-8
