

CONTENTS

PART I — METHODOLOGY	1
1. Introduction — <i>W. Cholewa and J.M. Kościelny</i>	3
1.1. Diagnostics of processes and its fundamental tasks	3
1.2. Main concepts	6
1.3. Aims of process diagnostics	11
1.4. General description of the diagnosed object	13
1.5. Basic concepts of process diagnostics	19
1.6. Summary	25
References	26
2. Models in the diagnostics of processes — <i>J.M. Kościelny</i>	29
2.1. Introduction	29
2.2. Relations in diagnostics	30
2.3. Models applied to fault detection	31
2.3.1. Physical equations	32
2.3.2. State equations of linear systems	33
2.3.3. State observers	34
2.3.4. Transfer functions of linear systems	35
2.3.5. Neural models	37
2.3.6. Fuzzy models	40
2.4. Models applied to fault isolation and system state recognition	44
2.4.1. Models mapping the space of binary diagnostic signals into the space of faults or system states	46
2.4.1.1. Binary diagnostic matrix	46
2.4.1.2. Diagnostic trees and graphs	48
2.4.1.3. Rules and logic functions	49
2.4.2. Models mapping the space of multi-value diagnostic signals into the space of faults or system states	50
2.4.2.1. Information system	50
2.4.2.2. Other models	53
2.4.3. Models mapping the space of continuous diagnostic signals into the space of faults or system states	54
2.4.3.1. Pattern pictures	54

2.4.3.2.	Neural networks	55
2.4.3.3.	Fuzzy neural networks	55
2.5.	Summary	55
	References	56
3.	Process diagnostics methodology — <i>J.M. Kościelny</i>	59
3.1.	Introduction	59
3.2.	Fault detection	59
3.2.1.	Fault detection using system models	60
3.2.1.1.	Generation of residuals on the grounds of physical equations	61
3.2.1.2.	Generation of residuals on the grounds of system transmittance	62
3.2.1.3.	Generation of residuals using state equations	64
3.2.1.4.	Generation of residuals on the grounds of state observers	66
3.2.1.5.	Generation of residuals using on-line identification	67
3.2.1.6.	Residual generation with neural and fuzzy models	68
3.2.1.7.	Algorithms for making a decision on fault detection using residual value evaluation	70
3.2.2.	Fault detection using tests of simple relationships existing between signals	72
3.2.2.1.	Application of hardware redundancy . . .	72
3.2.2.2.	Application of feedback signals	72
3.2.2.3.	Test of statistical relationships existing between process variables	72
3.2.2.4.	Testing the relations existing between process variables	73
3.2.3.	Methods of signal analysis and the testing of limits	74
3.2.3.1.	Analysis of statistic signal parameters . .	74
3.2.3.2.	Spectral analysis	75
3.2.3.3.	Methods of limit checking	76
3.3.	Fault isolation	79
3.3.1.	Diagnosing based on the binary diagnostic matrix .	80
3.3.1.1.	Rules of parallel diagnostic inference on the assumption about single faults . .	80
3.3.1.2.	Rules of series diagnostic inference on the assumption about single faults	81
3.3.1.3.	Inference with the inconsistency of symptoms	82

3.3.1.4.	System states with multiple faults	83
3.3.1.5.	Parallel inference on the assumption about multiple faults	85
3.3.1.6.	Series inference on the assumption about multiple faults	87
3.3.2.	Diagnosing based on the information system	87
3.3.2.1.	Parallel diagnostic inference based on the information system	88
3.3.2.2.	Series diagnostic inference based on the information system	88
3.3.3.	Methods of pattern recognition	89
3.3.4.	Recognition of directions in the space of residuals .	91
3.3.5.	Other methods	95
3.4.	Fault distinguishability	95
3.4.1.	Fault distinguishability based on the binary diagnostic matrix	96
3.4.2.	Distinguishability of system states based on the binary table of states	97
3.4.3.	Fault distinguishability based on the information system	98
3.4.4.	Fault distinguishability based on pattern recognition in the space of diagnostic signals	100
3.4.5.	Fault distinguishability improvement by taking the dynamics of symptoms into account	101
3.5.	Methods of the structural design of the set of detection algorithms	101
3.5.1.	Generation of secondary residuals based on physical equations	102
3.5.2.	Choice of a structural set of residuals generated on the basis of parity equations	103
3.5.3.	Banks of observers	105
3.5.4.	Design of a structured set of detection algorithms based on partial models	106
3.5.5.	Minimising the set of detection algorithms	107
3.6.	Fault identification	108
3.6.1.	Residual equations	109
3.6.2.	Residuals without the knowledge of the effect of faults	111
3.7.	Monitoring the system state	112
3.8.	Summary	113
	References	114

4. Methods of signal analysis — <i>W. Cholewa, J. Korbicz, W.A. Moczulski and A. Timofiejczuk</i>	119
4.1. Introduction	119
4.2. Signal classification	121
4.3. Initial pre-processing of signals	123
4.3.1. Analogue-to-digital conversion of signals	124
4.3.2. Filtering	124
4.3.3. Smoothing	129
4.3.4. Averaging	131
4.3.5. Principal component analysis	132
4.4. Non-parametric methods of signal feature estimation	134
4.4.1. Scalar feature estimation	134
4.4.2. Spectral analysis	135
4.4.3. Higher order spectral analysis	139
4.4.4. Analysis with the use of the wavelet transform	141
4.4.5. Analysis with the use of the Wigner-Ville transform	145
4.5. Parametric methods of signal estimation	145
4.6. Signal features estimated with respect to object properties	147
4.7. Summary	151
References	151
5. Control theory methods in designing diagnostic systems — <i>Z. Kowalczyk and P. Suchomski</i>	155
5.1. Introduction	155
5.2. Transfer function approach	157
5.2.1. Residue generation	157
5.2.2. Properties of the system matrix	163
5.2.3. Non-homogeneous residual reaction models	167
5.2.4. Homogeneous residual reaction models	171
5.3. Parity space approach	173
5.4. Deterministic assignment of state estimation	177
5.4.1. Full-order observer	177
5.4.2. Minimal-order observer	180
5.4.3. Observer matrix determination by pole placement	186
5.4.4. Detection observers of the Luenberger type	191
5.5. Linear Kalman filters	198
5.5.1. Models of estimated processes	199
5.5.2. Linear Kalman filtering founded on innovations	200
5.6. Summary	207
Appendix	208
References	213

6. Optimal detection observers based on eigenstructure assignment — <i>Z. Kowalczyk and P. Suchomski</i>	219
6.1. Introduction	219
6.2. System modelling	221
6.3. Preliminary synthesis of residuals	222
6.4. Conditions for disturbance decoupling	223
6.4.1. Necessary condition for decoupling	224
6.4.2. Sufficient conditions for decoupling	226
6.5. Parameterisation of attainable eigensubspaces	227
6.5.1. Separate spectra of the observer and the object	229
6.5.2. Mutuality in the spectra of the observer and the object	229
6.5.3. Partial observer gain	231
6.6. Synthesis of a numerically robust state observer	232
6.6.1. Separate spectra of the observer and the object	234
6.6.2. Mutuality in the spectra of the observer and the object	235
6.7. Synthesis of a numerically robust decoupled state observer	236
6.7.1. Numerically robust attainable decoupling	237
6.7.2. Complete observer gain	238
6.8. Completely decoupled observers	238
6.8.1. Dead-beat design of residue generators	239
6.8.2. Residue generation using parity equations	242
6.9. Numerical example	242
6.9.1. Decoupled dead-beat residue generator	243
6.9.2. Properties of dead-beat observers	244
6.9.3. Properties of non-dead-beat observers	249
6.9.4. Robustness of dead-beat observers	251
6.10. Summary	251
Appendices	253
A. Observability of dynamic systems	253
B. Useful geometric relationships	254
References	257
7. Robust H_∞-optimal synthesis of FDI systems — <i>P. Suchomski and Z. Kowalczyk</i>	261
7.1. Introduction	261
7.2. FDI design task as optimal filtering in H_∞	263
7.2.1. Optimal filtering based on the basic modelling of generalised processes	264

7.2.2.	Solution using the basic model	267
7.2.3.	Optimal filtering based on the dual modelling of generalised plants	272
7.2.4.	Solution using the dual model	274
7.2.5.	FDI filtering with the instrumental reference signal	280
7.3.	Synthesis of primary and secondary residual vectors	283
7.4.	Numerical example	286
7.5.	Summary	290
Appendices	291
A.	Discrete-time models	291
B.	Norms and spaces	292
C.	Factorisation	293
D.	Discrete Riccati equation	294
References	295
PART II — ARTIFICIAL INTELLIGENCE	299
8. Evolutionary methods in designing diagnostic systems		
— <i>A. Obuchowicz and J. Korbicz</i>	301
8.1.	Introduction	301
8.2.	Evolutionary algorithms	302
8.2.1.	Basic concepts of evolutionary search	303
8.2.2.	Some evolutionary algorithms	305
8.3.	Optimization tasks in designing FDI systems	308
8.4.	Symptom extraction	309
8.4.1.	Choice of the gain matrix for the robust non-linear observer via genetic programming	309
8.4.2.	Designing the robust residual generator using multi-objective optimization and evolutionary algorithms	312
8.4.3.	Evolutionary algorithms in the design of neural models	314
8.5.	Symptom evaluation	323
8.5.1.	Genetic clustering	324
8.5.2.	Evolutionary algorithms in designing the rule base	325
8.5.3.	Genetic adaptation of fuzzy systems	327
8.6.	Summary	329
References	329

9. Artificial neural networks in fault diagnosis	
— <i>K. Patan and J. Korbicz</i>	333
9.1. Introduction	333
9.2. Structure of a neural fault diagnosis system	334
9.3. Neural models in modelling	337
9.3.1. Multi-layer perceptron	337
9.3.2. Recurrent networks	339
9.3.3. Neural networks of the GMDH type	347
9.4. Fault classification using neural networks	352
9.4.1. Multi-layer perceptron	352
9.4.2. Kohonen network	352
9.4.3. Radial basic networks	354
9.4.4. Multiple network structure	356
9.5. Selected applications	357
9.5.1. Two-tank laboratory system	357
9.5.2. Instrumentation fault detection	365
9.5.3. Actuator fault detection and isolation	369
9.6. Summary	375
References	376
10. Parametric and neural network Wiener and Hammerstein models in fault detection and isolation — <i>A. Janczak</i> . . .	381
10.1. Introduction	381
10.2. Wiener and Hammerstein models	382
10.3. Identification of Wiener and Hammerstein systems	384
10.4. Parametric and neural network Wiener and Hammerstein models	386
10.4.1. Parametric models	387
10.4.2. Neural network models	388
10.5. Fault detection. Estimating parameter changes	389
10.5.1. Definitions of the identification error	390
10.5.2. Hammerstein system. Parameter estimation of the residual equation	393
10.5.3. Wiener system. Parameter estimation of the residual equation	396
10.6. Five-stage sugar evaporator. Identification of the nominal model of steam pressure dynamics	402
10.6.1. Theoretical model	402
10.6.2. Experimental models	403
10.6.3. Estimation results	404

10.7. Summary	407
References	407
11. Application of fuzzy logic to diagnostics — <i>J.M. Kościelny and M. Syfert</i>	411
11.1. Introduction	411
11.2. Fault detection	412
11.2.1. Wang and Mendel's fuzzy models	413
11.2.1.1. Construction of fuzzy models using Wang and Mendel's method	413
11.2.1.2. Modification of Wang and Mendel's method	415
11.2.1.3. Calculation of a residual on the basis of the fuzzy model	416
11.2.2. Fuzzy neural networks	417
11.2.2.1. Fuzzy neural networks with outputs in the form of singletons	418
11.2.2.2. TSK-type fuzzy neural networks	420
11.2.2.3. Fuzzy neural networks with outputs in the form of fuzzy sets	422
11.2.3. Example of fault detection	423
11.3. Fault isolation with the use of fuzzy logic	428
11.3.1. Fuzzy evaluation of residual values	429
11.3.2. Rules of inference	431
11.3.3. Fuzzy diagnostic inference	433
11.3.4. Example of fault isolation	437
11.3.5. Uncertainty of the diagnostic signals–faults relation	441
11.4. Fault isolation with the use of the fuzzy neural network	442
11.4.1. Realisation of fuzzy residual evaluation by the fuzzy neural network	444
11.4.2. Fault isolation in the fuzzy neural network	445
11.4.3. Example of fuzzy neural network application to fault isolation	449
11.5. Summary	450

19.4. Diagnostics in hierarchical structures	769
19.4.1. Hierarchical description of complex diagnostic systems	769
19.4.2. Diagnosing in hierarchical structures	774
19.5. Summary	778
References	778

20. Detection and isolation of manoeuvres in adaptive tracking filtering based on multiple model switching — <i>Z. Kowalczyk and M. Sankowski</i>	781
20.1. Introduction	781
20.2. Model of the measurement process	784
20.2.1. Sampling period	785
20.2.2. Radar measurements	785
20.2.3. Measurement equation	786
20.3. Modelling the target movement trajectory	787
20.3.1. Kinematic model of the planar curvilinear motion	787
20.3.2. Basic assumptions	789
20.3.3. Model of the uniform motion	790
20.3.4. Model of the uniform speed change	792
20.3.5. Model of the standard turn	793
20.4. State estimation during uniform motions	795
20.4.1. Base Kalman filter	795
20.4.2. Initiation of the tracking filter	796
20.5. Identification of the control signal	797
20.5.1. Input estimation method	797
20.5.2. Basic properties of the input estimation method	800
20.6. Detection and isolation of manoeuvres	800
20.6.1. Detection of manoeuvres	801
20.6.2. Isolation of manoeuvres	803
20.6.3. Identification of manoeuvre model parameters	806
20.7. Evaluation of the proposed methods	808
20.7.1. Properties of models of the standard turn	808
20.7.2. Simulation tests	809
20.7.3. Parametric identification of manoeuvre models	810
20.7.4. Manoeuvre recognition	812
20.7.5. Manoeuvre detection	813
20.7.6. Optimal window length of the IE/NIE estimator	815
20.8. Summary	816
References	817
21. Detecting and locating leaks in transmission pipelines — <i>Z. Kowalczyk and K. Gunawickrama</i>	821
21.1. Introduction	821
21.2. Transmission pipeline process	824
21.2.1. Pipe instrumentation	824
21.2.2. Technical parameters of the pipe	825

21.2.3.	Technological effects of leaks on pipeline measurements	826
21.2.4.	Physical model of fluid flow in the pipe	828
21.3.	Analytical leak detection and isolation methods for pipelines	829
21.3.1.	Volume balancing approach	830
21.3.2.	Fault-sensitive and fault model approaches	830
21.4.	Fault-sensitive approach	831
21.4.1.	Model of the transmission pipeleg	833
21.4.2.	Residue generation via nonlinear state observation	834
21.4.3.	Leak parameters	835
21.4.4.	On-line estimation of the friction coefficient	837
21.4.5.	Exemplary monitoring with the use of the FSA-LDS	839
21.5.	Fault model approach	845
21.5.1.	Mathematical model of the pipeleg	846
21.5.2.	Determining the leak size and location	850
21.5.3.	Minimisation of modelling errors via the extended Kalman filtering	853
21.5.4.	Exemplary monitoring through the FMA-LDS	856
21.6.	Summary	861
	References	862
22.	Models in the diagnostics of processes — <i>J.M. Kościelny, M. Bartyś, M. Syfert and M. Pawlak</i>	865
22.1.	Introduction	865
22.2.	Fault diagnosis of the steam-water line of the power boiler	866
22.2.1.	System description	866
22.2.2.	Fault detection of the water-steam line of the power boiler	869
22.2.3.	Fault isolation of the water-steam line of the power boiler	871
22.3.	Fault diagnosis of the evaporation station in a sugar factory	875
22.3.1.	System description	875
22.3.2.	Fault detection of the evaporator	878
22.3.3.	Fault isolation in the evaporator	882
22.4.	Fault diagnosis of the pneumatic actuator-positioner-control valve assembly	883
22.4.1.	Introduction – the aims of the diagnostics of final control elements	883

22.4.2. Fault detection of the final control element	885
22.4.3. Fault isolation of the final control element	888
22.5. Fault diagnosis of the condensation power turbine controller tolerating instrumentation faults	893
22.5.1. Condensation turbine controller	893
22.5.2. Diagnostics of instrumentation	895
22.6. Summary	900
References	900
