
Table of Contents

Preface	V
Conference Participants	XI

Invited Papers

Finance: A Fertile Field for Applications of MC and QMC <i>Phelim P. Boyle</i>	1
How Many Random Bits Do We Need for Monte Carlo Integration? <i>Stefan Heinrich, Erich Novak, and Harald Pfeiffer</i>	27
On Tractability of Weighted Integration for Certain Banach Spaces of Functions <i>Fred J. Hickernell, Ian H. Sloan, and Grzegorz W. Wasilkowski</i>	51
Polynomial Integration Lattices <i>Pierre L'Ecuyer</i>	73
Approximate Bayesian Computation and MCMC <i>Vincent Plagnol and Simon Tavaré</i>	99
New Challenges for the Simulation of Stochastic Processes <i>Denis Talay</i>	115
Stochastic Models and Monte Carlo Algorithms for Boltzmann Type Equations <i>Wolfgang Wagner</i>	129
Digital Nets, Duality, and Algebraic Curves <i>Chaoping Xing and Harald Niederreiter</i>	155

Contributed Papers

Generalized Mersenne Prime Number and Its Application to Random Number Generation <i>Lih-Yuan Deng</i>	167
Constructing Good Lattice Rules with Millions of Points <i>Josef Dick and Frances Y. Kuo</i>	181
Lattice Structure of Nonlinear Pseudorandom Number Generators in Parts of the Period <i>Gerhard Dorfer and Arne Winterhof</i>	199
Simulation for American Options: Regression Now or Regression Later? <i>Paul Glasserman and Bin Yu</i>	213
Perturbation Monte Carlo Methods for the Solution of Inverse Problems <i>Carole K. Hayakawa and Jerome Spanier</i>	227
Quantum Boolean Summation with Repetitions in the Worst-Average Setting <i>Stefan Heinrich, Marek Kwas, and Henryk Woźniakowski</i>	243
The Strong Tractability of Multivariate Integration Using Lattice Rules <i>Fred J. Hickernell, Ian H. Sloan, and Grzegorz W. Wasilkowski</i>	259
Minimizing Effective Dimension Using Linear Transformation <i>Junichi Imai and Ken Seng Tan</i>	275
Component by Component Construction of Rank-1 Lattice Rules Having $O(n^{-1}(\ln(n))^d)$ Star Discrepancy <i>Stephen Joe</i>	293
Stratification by Rank-1 Lattices <i>Alexander Keller</i>	299
Walsh Series Analysis of the Star Discrepancy of Digital Nets and Sequences <i>Gerhard Larcher and Friedrich Pillichshammer</i>	315
Quasi-Monte Carlo Methods for Estimating Transient Measures of Discrete Time Markov Chains <i>Christian Lécot and Bruno Tuffin</i>	329
Quasi-Monte Carlo Methods for Elliptic BVPs <i>Michael Mascagni, Aneta Karaivanova, and Chi-Ok Hwang</i>	345

Stable Connectivity of Networks and Its Monte Carlo Estimation <i>Hozumi Morohosi and Tatsuo Oyama</i>	357
Random Number Generators Based on Linear Recurrences in \mathbb{F}_{2^w} <i>François Panneton and Pierre L'Ecuyer</i>	367
Using Quasi-Monte Carlo Scenarios in Risk Management <i>Filip Pistovčák and Thomas Breuer</i>	379
Adaptive Quasi-Monte Carlo Integration Based on MISER and VEGAS <i>Rudolf Schürer</i>	393
When Does Monte Carlo Depend Polynomially on the Number of Variables? <i>Ian H. Sloan and Henryk Woźniakowski</i>	407
A New Adaptive Method for Geometric Convergence <i>Jerome Spanier and Rong Kong</i>	439
Polynomial Arithmetic Analogue of Hickernell Sequences <i>Shu Tezuka</i>	451

Monte Carlo and Quasi-Monte Carlo Methods 2002
Proceedings of a Conference held at the National
University of Singapore, Republic of Singapore,
November 25–28, 2002
Niederreiter, H. (Ed.)
2004, XX, 460 p. 27 illus., Softcover
ISBN: 978-3-540-20466-4
