
Contents

1	Introduction to the Compensation Systems	1
1.1	Helium Cryogenics and its Applications	3
1.2	Compensation Systems Containing Bellows Expansion Joints	11
1.2.1	The Principle of Thermo–Mechanical Compensation	11
1.2.2	Reliability Aspects of Cryogenic Compensation Systems	19
1.3	Bellows Expansion Joints	22
1.3.1	State of Art: Corrugated Bellows and Toroidal Shells	22
1.3.2	Bellows Expansion Joints for Low Temperature Applications	31
1.4	Materials Applied at Low Temperatures	38
2	Thermodynamics of Processes Occurring in Metals at Low Temperatures	41
2.1	Types of Metallic Lattice and its Imperfections	41
2.2	Heat Transport in Metals at Low Temperatures	47
2.3	Thermodynamic Instabilities at the Temperatures Close to Absolute Zero	53
2.4	Mechanism of Inelastic Deformations in Ductile Metals at Low Temperatures	56
3	Properties of Austenitic Stainless Steels at Cryogenic Temperatures	65
3.1	Metallurgical Aspect (Chemical Composition and Structure)	65
3.2	Metallurgical Stability at Low Temperatures — Martensitic Transformation and Magnetic Permeability	66
3.3	Mechanical Properties: Tensile and Fatigue Tests at Low Temperatures	68
3.4	Classical versus Serrated Yielding	73

4	Plastic Yielding and Evolution of Ductile Damage under Cryogenic Conditions	77
4.1	Modelling of Plastic Yielding at Cryogenic Temperatures	77
4.1.1	Smooth Stress–Strain Curves	77
4.1.2	Serrated (Discontinuous) Yielding	82
4.2	Ductile Damage and the Kinetic Laws of Damage Evolution	85
4.2.1	Damage Variable and the Effective Stresses	85
4.2.2	The Variable (Y) Associated with Damage (D): Dual Variables	87
4.2.3	Potential of Dissipation and Kinetic Law of Damage Evolution	89
4.2.4	Identification of Parameters of the Kinetic Law of Damage Evolution at Room and at Cryogenic Temperatures	91
4.2.5	Orthotropic Damage in Ductile Materials at Cryogenic Temperatures	95
4.3	Accumulation of Damage due to Cyclic Loads. Effect of Large Mean Plastic Strain on the Number of Cycles to Failure	103
4.3.1	Accumulated Mean Strain of the Order of the Tensile Ductility	104
4.3.2	Solution Based on the Kinetic Law of Damage Evolution	106
4.3.3	Linear Evolution of the Mean Plastic Strain as a Function of Time	109
4.3.4	Comparison with the Experimental Results	110
4.3.5	Generalised Manson–Coffin Formula. Constant Mean Plastic Strain (Finite Ratchetting)	111
4.4	Numerical Modelling of Damage Accumulation	113
4.4.1	The Partially Coupled Approach to Plasticity–Damage	114
4.4.2	The Uncoupled Approach to Plasticity–Damage Analysis	115
5	Strain Induced Martensitic Transformation at Low Temperatures	119
5.1	Constitutive Models of Steels Exhibiting Strain Induced Martensitic Transformation	119
5.2	Transformation Kinetics at Cryogenic Temperatures	121
5.3	Constitutive Modelling of Plastic Flow in the Presence of Strain Induced Martensitic Transformation at Cryogenic Temperatures	123
5.4	Combined Model of Plastic Strain Induced Damage Evolution and Martensitic Transformation	130
5.5	Integration of the Constitutive Equations and Comparison with the Experimental Data	132
5.6	Combined Model of Plastic Strain Induced Orthotropic Damage and $\gamma \rightarrow \alpha'$ Phase Transformation	134

6	Stability of Corrugated Axisymmetric Shells (Bellows)	137
6.1	Mechanism of Buckling of the Corrugated Bellows	137
6.2	Reissner–Meissner Equations Applied to Corrugated Axisymmetric Shells	138
6.2.1	Geometry of Typical Corrugated Bellows	140
6.2.2	Rotationally Symmetric Deformation (Large Displacements, Small Strains)	142
6.2.3	Overall Small Bending (Small Displacements, Small Strains)	146
6.2.4	Numerical Solution	150
6.3	Concept of Equivalent Column in the Stability of Corrugated Axisymmetric Shells	151
6.3.1	The Equivalent Column Concept	151
6.3.2	Model of the Equivalent Column	152
6.3.3	Strategy for Computation of the Critical Force	153
6.3.4	Simple Applications — type-S (Toroidal) Convolutions	155
6.4	Effect of Relaxation of Boundary Conditions on Buckling of Systems Containing Corrugated Bellows	159
6.5	Shear Deformation versus the Bifurcation Buckling Load	161
6.5.1	Eigenvalue Problem for the Column with a Finite Shear Stiffness	162
6.5.2	Definition of Bending and Shear Stiffness of Corrugated Bellows	165
6.5.3	Effect of Shear on Buckling of Short Corrugated Bellows	166
6.5.4	Stability of Systems Equipped with Short Bellows: Relaxation of Support Conditions and Shear Effect	167
6.6	Effect of Torsion on Bifurcation Buckling of Corrugated Bellows (Torque/Pressure Interaction Curves)	170
7	Material and Fatigue Induced Structural Instabilities of Corrugated Bellows at Low Temperatures	175
7.1	Introduction to the Phenomena Observed in Corrugated Bellows at Low Temperatures	175
7.2	Mechanisms of Plastic Adaptation in Bellows under Combined Loads	176
7.2.1	The governing Equations for Elastic–Perfectly Plastic Bellows	177
7.2.2	The Reduced Set of Equations and the Boundary Value Problem	180
7.2.3	Limit Analysis	183
7.2.4	Mechanisms of Adaptation and Inadaptation to Cyclic Loading	185
7.2.5	Adaptation and Inadaptation Domains	193

7.3	Plastic Strain Induced Damage Evolution and Martensitic Transformation in the Bellows Convolutions at Cryogenic Temperatures	194
7.4	Mechanism of Fatigue Induced Structural Instability	200
7.5	Evolution of Plastic Strain Fields and Damage in the Corrugated Bellows under Cyclic Loads at Cryogenic Temperatures	205
7.5.1	Simplified Constitutive Model of Stainless Steels at Cryogenic Temperatures	205
7.5.2	Numerical Simulation of Evolution of the Plastic Strain Intensity in Bellows Convolutions at Cryogenic Temperatures	207
7.5.3	Numerical Simulation of Damage Evolution in Bellows Convolutions at Cryogenic Temperatures	210
7.6	Fatigue Induced Evolution of Bellows Axial Stiffness and its Effect on Buckling	211
8	Reliability Oriented Optimum Design Of Cryogenic Compensation Systems	217
8.1	Reliability of Systems and Classification of Failures	217
8.2	Reliability Categories	218
8.3	Global Approach in the Optimisation Procedure	220
8.3.1	Optimisation with respect to the Buckling Load (Minimum Buckling Failure Probability)	221
8.3.2	Optimisation with respect to the Global Cost of the Structure Under Failure Probability Constraints	222
8.3.3	Optimisation with respect to the Cost and the Global Buckling Load	223
8.4	Local Approach in the Optimisation (Interconnections)	224
8.5	Optimum Design of the Cryogenic Corrugated Bellows	226
8.5.1	Reliability Oriented Optimisation — Probabilistic Approach	226
8.5.2	Classical Optimisation — Deterministic Approach	227
9	Applications: Accelerators for High Energy Physics and Cryogenics Transfer Lines	233
9.1	Lepton and Hadron Colliders — Modern Tools of High Energy Physics	233
9.1.1	Superconducting Magnets and the Relevant Technology	236
9.1.2	Technology of Ultra-High Vacuum for the Beam Lines	238
9.2	Design of Compact Expansion Joints for Beam Vacuum Systems	241
9.2.1	The Beam Vacuum Interconnects of the LHC	241
9.2.2	Very Compact Solution — Nested Bellows	243
9.2.3	Metallurgical Analysis of Nested Bellows	245

Compensation Systems for Low Temperature
Applications

Skoczen, B.T.

2004, XVII, 291 p., Hardcover

ISBN: 978-3-540-22202-6
