Introduction	1
1. The notion of quality of a finite element solution	7
1.1 Introduction	7
1.2 The reference model	9
1.3 The approximate problem and discretization errors	14
1.3.1 Linear problems	15
1.3.2 Nonlinear problems	19
1.3.3 Evaluation of the discretization errors	22
1.3.4 A priori estimates	22
1.3.5 A posteriori estimates	23
1.3.6 Qualities of an estimator	25
1.4 Extensions and general references	27
2. The constitutive relation error method for linear problems	29
2.1 Introduction	29
2.2 Error in constitutive relation	31
2.2.1 Admissible approximate solution	31
2.2.2 Error in constitutive relation in the linear case	32
2.3 Properties of the error in constitutive relation	34
2.3.1 New formulation for an elasticity problem	34
2.3.2 Potential energy and complementary energy	35
2.3.3 Extensions	37

2.4	Utilization in finite element calculations	38
2.4.1	Construction of an admissible pair	38
2.4.2	Displacement field.....	39
2.4.3	Stress field.....	39
2.4.4	Relationship with the errors in the solution	47
2.4.5	Asymptotic behavior	49
3.	Other methods for linear problems	51
3.1	Introduction.....	51
3.2	Methods based on equilibrium residuals.....	52
3.2.1	General principle.....	52
3.2.2	Explicit estimators.....	55
3.2.3	Implicit estimators.....	58
3.2.4	Comments	64
3.3	Methods based on a smoothing of the stresses	65
3.3.1	General principle.....	65
3.3.2	The ZZ1 method.....	66
3.3.3	Recovery by local smoothing (ZZ2).....	67
3.3.4	Some variants.....	70
3.3.5	Comments	71
3.4	Iterative bounding techniques.....	71
3.4.1	The basic identity.....	72
3.4.2	The iterative bounding technique.....	75
3.4.3	Comments	76
4.	Principles of the comparison of the various estimators in the linear case	79
4.1	Introduction.....	79
4.2	Errors in constitutive relation.....	80
4.2.1	A 2D example.....	80
4.2.2	Comparison of the different methods of construction.....	81
4.3	Global effectivity index.....	83
4.3.1	Comparison of estimators for a thermal problem.....	83
4.3.2	Comparison for an elasticity problem.....	85
4.3.3	Analysis of the quality of the improved estimator	88
4.4	Common versions of the constitutive relation estimators	90
5.	Mesh adaptation for linear problems	91
5.1	Introduction.....	91
5.2	Mesh adaptation techniques	94
5.2.1	The r -version.....	94
5.2.2	The h -version.....	95
5.2.3	The p -version	98
5.3	Mesh adaptation	100
5.3.1	Adaptation by local refinement.....	100
5.3.2	Adaptation by global remeshing.....	101

5.3.3	Construction of an optimum mesh.....	107
5.3.4	Verification of optimality	110
5.4	Treatment of high-gradient zones.....	113
5.4.1	High-gradient zones.....	113
5.4.2	Study of a test example.....	114
5.4.3	Taking into account high-gradient zones	118
5.4.4	Automatic detection of high-gradient zones	121
5.4.5	Extension to stress concentration zones	125
5.4.6	A 3D example of adaptation.....	125
5.5	Toward the automation of finite element analyses.....	128
5.5.1	Objectives.....	128
5.5.2	An automation algorithm	128
5.5.3	Comments.....	131
5.6	Examples	131
5.6.1	First example	131
5.6.2	Second example.....	133
5.6.3	Third example	136
6.	The constitutive relation error method for nonlinear evolution problems	139
6.1	Introduction.....	139
6.2	Plasticity and viscoplasticity in small perturbations	141
6.2.1	Reconsideration of the reference problem	141
6.2.2	The constitutive relation	142
6.3	Error in DRUCKER's sense	151
6.3.1	Admissible fields.....	151
6.3.2	Definition of the error measure.....	151
6.3.3	Construction of the admissible fields.....	158
6.3.4	Error indicators in time and in space	163
6.3.5	Global effectivity index.....	169
6.4	Dissipation error.....	174
6.4.1	Admissible fields.....	174
6.4.2	Measures of the dissipation error.....	175
6.4.3	Error in the solution.....	176
6.4.4	Relative error.....	179
6.4.5	Construction of the admissible fields.....	179
6.4.6	Error indicators in time and in space	182
6.5	Examples	186
6.5.1	Comparison of the two errors	187
6.5.2	Behavior of the errors and of their specific indicators	188
6.6	Adaptive control of the calculations.....	192
6.7	Generalizations.....	196
6.7.1	Extension to bistandard formulations	196
6.7.2	Extension to bipotential formulations.....	198
6.7.3	Application to unilateral contact problems	199
6.7.4	Extension to problems with large transformations.....	203
6.7.5	Extension to damage-prone materials.....	203

7.	The constitutive relation error method in dynamics	207
7.1	Introduction.....	207
7.2	Linear vibrations.....	209
7.2.1	Formulation of the problem.....	209
7.2.2	Finite element discretization.....	211
7.2.3	The new formulation	212
7.2.4	Method for finding bounds of the exact eigenfrequencies	214
7.2.5	Implementation of the bounding method.....	216
7.2.6	Evaluation of the constant k_s	222
7.2.7	Practical method for constructing bounds.....	227
7.2.8	Example.....	228
7.2.9	Adaptive vibration calculations.....	231
7.3	Transient dynamics	240
7.3.1	New formulation of the reference problem	240
7.3.2	Extension of DRUCKER's stability condition.....	242
7.3.3	Error in constitutive relation.....	244
7.3.4	Discretization of the reference problem	248
7.3.5	Construction of admissible triplets.....	252
7.3.6	Error indicators in time and in space.....	259
7.3.7	Mass diagonalization error indicator.....	266
7.3.8	Simple examples	269
8.	Techniques for constructing admissible fields	277
8.1	Introduction.....	277
8.2	The 2D thermal-type problem	279
8.2.1	Formulation of the problem.....	279
8.2.2	Finite element discretization.....	280
8.2.3	Construction of admissible fields.....	281
8.3	2D elasticity problems.....	290
8.3.1	Construction of the densities in elasticity	290
8.3.2	Construction of admissible stress fields	294
8.4	Axisymmetric elasticity problems	300
8.4.1	Construction of the densities.....	301
8.4.2	Construction of the stress field.....	303
8.4.3	Specific treatment at nodes located on the axis.....	304
8.5	3D elasticity problems.....	307
8.5.1	Construction of the densities.....	307
8.5.2	Construction of admissible stress fields	309
8.6	Improved construction of the densities.....	311
8.6.1	Weak extension condition.....	311
8.6.2	Notations and preliminary results.....	312
8.6.3	Decomposition of the densities.....	313
8.6.4	New construction of the densities.....	315
8.7	Incompressible or nearly incompressible elasticity	323
8.7.1	The reference problem.....	323
8.7.2	Error in constitutive relation.....	324

8.7.3	Discretization of the problem.....	325
8.7.4	Construction of the admissible fields.....	326
8.7.5	Examples	329
8.8	Elastic plates.....	332
8.8.1	The KIRCHHOFF - LOVE bending model.....	333
8.8.2	Error in constitutive relation.....	334
8.8.3	Application to finite element calculation methods.....	335
8.8.4	Construction of an admissible pair.....	336
8.8.5	Examples	338
8.9	Asymptotic behavior.....	341
9.	Estimation of local errors	349
9.1	Introduction.....	349
9.2	Reconsideration of the reference problem.....	351
9.3	A heuristic property of the local stress errors.....	351
9.3.1	Local effectivity indexes.....	351
9.3.2	Examples	352
9.3.3	An estimation of the error in local stresses.....	360
9.4	Types of local quantities to be estimated.....	361
9.4.1	Average variables associated with the stress.....	361
9.4.2	Average variable associated with displacement.....	365
9.4.3	Extraction operators.....	367
9.4.4	Estimation of the local errors.....	369
9.4.5	Example	377
9.4.6	Comments.....	379
	Bibliography	381
	Index	411

Mastering Calculations in Linear and Nonlinear
Mechanics

Ladevèze, P.; Pelle, J.P.

2005, XI, 413 p., Hardcover

ISBN: 978-0-387-21294-4
