
Contents

1	Introduction	1
1.1	Motivational thoughts	2
1.2	Goals of the monograph	6
1.3	Structure of the book	7
2	Basic Concepts	9
2.1	Conditional independence	9
2.2	Semi-graphoid properties	11
2.2.1	Formal independence models	11
2.2.2	Semi-graphoids	13
2.2.3	Elementary independence statements	15
2.2.4	Problem of axiomatic characterization	16
2.3	Classes of probability measures	17
2.3.1	Marginally continuous measures	19
2.3.2	Factorizable measures	22
2.3.3	Multiinformation and conditional product	24
2.3.4	Properties of multiinformation function	27
2.3.5	Positive measures	29
2.3.6	Gaussian measures	30
2.3.7	Basic construction	36
2.4	Imsets	39
3	Graphical Methods	43
3.1	Undirected graphs	43
3.2	Acyclic directed graphs	46
3.3	Classic chain graphs	52
3.4	Within classic graphical models	54
3.4.1	Decomposable models	55
3.4.2	Recursive causal graphs	56
3.4.3	Lattice conditional independence models	56
3.4.4	Bubble graphs	57

3.5	Advanced graphical models	57
3.5.1	General directed graphs	57
3.5.2	Reciprocal graphs	58
3.5.3	Joint-response chain graphs	58
3.5.4	Covariance graphs	59
3.5.5	Alternative chain graphs	60
3.5.6	Annotated graphs	60
3.5.7	Hidden variables	61
3.5.8	Ancestral graphs	62
3.5.9	MC graphs	62
3.6	Incompleteness of graphical approaches	63
4	Structural Imsets: Fundamentals	65
4.1	Basic class of distributions	65
4.1.1	Discrete measures	65
4.1.2	Regular Gaussian measures	66
4.1.3	Conditional Gaussian measures	66
4.2	Classes of structural imsets	69
4.2.1	Elementary imsets	69
4.2.2	Semi-elementary and combinatorial imsets	71
4.2.3	Structural imsets	73
4.3	Product formula induced by a structural imset	74
4.3.1	Examples of reference systems of measures	75
4.3.2	Topological assumptions	76
4.4	Markov condition	78
4.4.1	Semi-graphoid induced by a structural imset	78
4.4.2	Markovian measures	81
4.5	Equivalence result	83
5	Description of Probabilistic Models	87
5.1	Supermodular set functions	87
5.1.1	Semi-graphoid produced by a supermodular function	88
5.1.2	Quantitative equivalence of supermodular functions	90
5.2	Skeletal supermodular functions	92
5.2.1	Skeleton	93
5.2.2	Significance of skeletal imsets	95
5.3	Description of models by structural imsets	99
5.4	Galois connection	102
5.4.1	Formal concept analysis	102
5.4.2	Lattice of structural models	104

6	Equivalence and Implication	111
6.1	Two concepts of equivalence	111
6.1.1	Independence and Markov equivalence	113
6.2	Independence implication	114
6.2.1	Direct characterization of independence implication	115
6.2.2	Skeletal characterization of independence implication	118
6.3	Testing independence implication	120
6.3.1	Testing structural imsets	120
6.3.2	Grade	122
6.4	Invariants of independence equivalence	124
6.5	Adaptation to a distribution framework	126
7	The Problem of Representative Choice	131
7.1	Baricentral imsets	131
7.2	Standard imsets	135
7.2.1	Translation of DAG models	135
7.2.2	Translation of decomposable models	137
7.3	Imsets of the smallest degree	141
7.3.1	Decomposition implication	142
7.3.2	Minimal generators	142
7.4	Span	145
7.4.1	Determining and unimarginal classes	145
7.4.2	Imsets with the least lower class	146
7.4.3	Exclusivity of standard imsets	148
7.5	Dual description	149
7.5.1	Coportraits	149
7.5.2	Dual baricentral imsets and global view	152
8	Learning	155
8.1	Two approaches to learning	155
8.2	Quality criteria	161
8.2.1	Criteria for learning DAG models	163
8.2.2	Score equivalent criteria	169
8.2.3	Decomposable criteria	170
8.2.4	Regular criteria	171
8.3	Inclusion neighborhood	177
8.4	Standard imsets and learning	181
8.4.1	Inclusion neighborhood characterization	181
8.4.2	Regular criteria and standard imsets	184
9	Open Problems	189
9.1	Theoretical problems	189
9.1.1	Miscellaneous topics	189
9.1.2	Classification of skeletal imsets	195
9.2	Operations with structural models	199

9.2.1	Reductive operations	199
9.2.2	Expansive operations	202
9.2.3	Cumulative operations	203
9.2.4	Decomposition of structural models	203
9.3	Implementation tasks	207
9.4	Interpretation and learning tasks	209
9.4.1	Meaningful description of structural models	209
9.4.2	Tasks concerning distribution frameworks	210
9.4.3	Learning tasks	211
A	Appendix	215
A.1	Classes of sets	215
A.2	Posets and lattices	216
A.3	Graphs	218
A.4	Topological concepts	221
A.5	Finite-dimensional subspaces and convex cones	222
A.5.1	Linear subspaces	222
A.5.2	Convex sets and cones	223
A.6	Measure-theoretical concepts	226
A.6.1	Measure and integral	227
A.6.2	Basic measure-theoretical results	228
A.6.3	Information-theoretical concepts	230
A.6.4	Conditional probability	232
A.7	Conditional independence in terms of σ -algebras	234
A.8	Concepts from multivariate analysis	236
A.8.1	Matrices	236
A.8.2	Statistical characteristics of probability measures	238
A.8.3	Multivariate Gaussian distributions	239
A.9	Elementary statistical concepts	241
A.9.1	Empirical concepts	242
A.9.2	Statistical conception	244
A.9.3	Likelihood function	245
A.9.4	Testing statistical hypotheses	246
A.9.5	Distribution framework	248
	List of Notation	251
	List of Lemmas, Propositions etc.	259
	References	263
	Index	273

Probabilistic Conditional Independence Structures

Studeny, M.

2005, XIV, 285 p. 42 illus., Hardcover

ISBN: 978-1-85233-891-6
