Preface	V
Contents	VII
 Wavelet Methods for Stationary PDEs and PDE-Constrained Control Problems 1	
<i>Angela Kuno</i>	
1 Introduction	1
2 Problem Classes	4
2.1 An Abstract Operator Equation	4
2.2 Elliptic Boundary Value Problems	5
2.3 Saddle Point Problems Involving Boundary Conditions	7
2.4 PDE-Constrained Control Problems: Distributed Control	10
2.5 PDE-Constrained Control Problems: Dirichlet Boundary Control	12
3 Wavelets	13
3.1 Basic Properties	13
3.2 Norm Equivalences and Riesz Maps	16
3.3 Representation of Operators	18
3.4 Multiscale Decomposition of Function Spaces	19
4 Problems in Wavelet Coordinates	33
4.1 Elliptic Boundary Value Problems	33
4.2 Saddle Point Problems Involving Boundary Conditions	35
4.3 Control Problems: Distributed Control	37
4.4 Control Problems: Dirichlet Boundary Control	42
5 Iterative Solution	44
5.1 Finite Systems on Uniform Grids	44
5.2 Adaptive Schemes	51
References	60
 On Approximation in Meshless Methods 65	
<i>Jens Markus Melenk</i>	
1 Introduction	65
1.1 Notation	66
1.2 The Notion of Optimality	68
2 Polynomial Reproducing Systems	69
2.1 Motivation	69
2.2 Approximation Properties of Systems Reproducing Polynomials	70
2.3 Construction of Shape Functions with the Moving Least Squares Procedure	76
2.4 Bibliographical Remarks	87
3 Approximation Properties of Radial Basis Functions	87
3.1 Analysis of a Class of RBFs	88

VIII Contents

3.2	Bibliographical Remarks	92
4	Partition of Unity Method and Generalized FEM	93
4.1	Approximation Theory	93
4.2	Example: Polynomial Local Approximation Spaces	95
5	Examples of Operator Adapted Approximation Spaces	96
5.1	A One-Dimensional Example	97
5.2	Laplace's Equation	100
5.3	Helmholtz Equation	102
5.4	Linear Elasticity	103
5.5	Further Examples	105
5.6	Local Approximation Spaces Obtained Numerically	105
5.7	Bibliographical Remarks	106
6	Augmenting Classical FEM Spaces	106
6.1	Singular Functions	106
6.2	Crack Propagation Problems	108
6.3	Further Examples: The Generalized FEM	111
6.4	Bibliographical Remarks	111
7	Enforcement of Essential Boundary Conditions	111
7.1	Conforming Methods	112
7.2	Non-Conforming Methods: Lagrange Multiplier Methods and Collocation Techniques	115
7.3	Non-Conforming Methods: Penalty Method	116
7.4	Non-Conforming Methods: Nitsche's Method	119
A	Results from Analysis	122
B	Properties of Polynomials	123
C	Approximation with Adapted Function Systems	126
C.1	The Theory of Bergman and Vekua	126
C.2	Proof of Theorems 5.3, 5.4	127
C.3	Two-Dimensional Elasticity	130
	References	136

Theory and Applications of Smoothed Particle Hydrodynamics143

Joseph J. Monaghan

1	Introduction	143
2	Integral and Summation Interpolants	144
2.1	Errors in the Integral Interpolant	148
2.2	Errors in the Summation Interpolant	149
2.3	Errors when the Particles are Disordered	152
3	Euler Equations	155
3.1	The SPH Continuity Equation	156
3.2	The SPH Acceleration Equation	157
3.3	The Thermal Energy Equation	158
3.4	Dispersion of Sound Waves	159
4	Tests of the SPH Euler Equations	161
4.1	The Force Law in One Dimension	162

4.2	The Equations of Motion	163
4.3	Oscillations	164
4.4	SPH Results for Small Oscillations	165
5	Lagrangian SPH	167
5.1	The Lagrangian	167
5.2	Conservation Laws	168
5.3	The Lagrangian with Constraints	172
5.4	Resolution Varying in Space and Time	174
6	SPH Heat Conduction	177
6.1	Derivatives from Integrals	178
6.2	Does the Entropy Increase?	179
6.3	Discontinuous Thermal Conductivity	180
6.4	Diffusion of Matter	181
7	Viscosity	183
7.1	A Simple Artificial Shock Viscosity	183
7.2	Invariance Properties	185
7.3	Effective Pressure and Viscosity	186
7.4	The Sign of the Dissipation Term	186
8	Applications to Shock and Rarefaction Problems	187
8.1	Rarefaction Waves	187
8.2	The Sod Shock Tube	187
	References	193
	Implementation and Parallelization of Meshfree Methods	195
	<i>Marc Alexander Schweitzer</i>	
1	Introduction	195
2	Partition of Unity Method	197
2.1	Construction of a Partition of Unity Space	197
2.2	Variational Formulation and Boundary Conditions	204
2.3	Galerkin Discretization	209
2.4	Solution of Resulting Linear System	210
3	Efficient Implementation	212
3.1	Cover Construction	212
3.2	Numerical Integration	217
3.3	Multilevel Solution of Linear System	231
4	Parallelization	243
4.1	Parallel Data Decomposition	244
4.2	Load Balancing with Space Filling Curves	248
4.3	Parallel Cover Construction	250
4.4	Parallel Neighbour Search	252
4.5	Parallel Matrix Assembly	254
4.6	Parallel Multilevel Solution	254
4.7	Computational Complexity	257
	References	258

Frontiers of Numerical Analysis
