

Table of contents

Systems Biology: Did we know it all along?	3
Hans V. Westerhoff and Lilia Alberghina	3
Abstract	3
1 Is Systems Biology something new?	3
2 Is it important?	5
3 What is it?	6
4 Did we know it all along?.....	8
5 Will it work?.....	8
References	9

METHODS

From isolation to integration, a systems biology approach for building the Silicon Cell	13
Jacky L. Snoep and Hans V. Westerhoff	13
Abstract	13
1 Systems biology	13
2 What makes systems biology different from other systems approaches? ..	14
3 Isolation and characterization.....	15
4 A modular approach	16
5 Integration	18
6 Validation.....	18
7 Yeast glycolysis as an example	19
8 The Silicon Cell.....	22
9 JWS - Online Cellular Systems Modelling.....	23
10 How far are we, and what needs to be done?	26
References	28

Kinetic modelling of the <i>E. coli</i> metabolism	31
Oleg V. Demin, Tatyana Y. Plyusnina, Galina V. Lebedeva, Ekaterina A. Zbova, Eugeniy A. Metelkin, Alex G. Kolupaev, Igor I. Goryanin, and Frank Tobin.....	31
Abstract	31
1 Introduction	31
2 Basic principles of kinetic model construction.....	32
2.1 Development of system of ordinary differential equations (ODEs) describing dynamics of selected biochemical system.....	32
2.2 Basic principles of kinetic description of enzymatic reactions using <i>in vitro</i> experimental data.....	36

2.3 Derivation of rate equation of histidinol dehydrogenase of <i>Escherichia coli</i> and estimation of its kinetic parameters using <i>in vitro</i> experimental data.....	37
3 Application of the <i>Escherichia coli</i> branched-chain amino acid biosynthesis model. Prediction of possible genetic changes that should maximize isoleucine and valine production	45
3.1 Model development	47
3.2 Application of kinetic model to optimize production of isoleucine and valine.....	61
4 Discussion	65
References	65
Metabolic Control Analysis	69
David A. Fell	69
Abstract	69
1 Introduction	69
2 Relating system variables to enzyme kinetics	71
3 Generic properties of metabolic systems.....	72
4 Perspectives for the future.....	76
References	78
No music without melody: How to understand biochemical systems by understanding their dynamics.....	81
Ursula Kummer and Lars Folke Olsen	81
Abstract	81
1 Introduction: Dynamics is a systems property essential for systems biology	81
2 Nonlinear dynamics displayed and used by single-enzyme reactions.....	83
3 Nonlinear dynamics displayed and used by metabolic pathways.....	85
4 Nonlinear dynamics displayed and used by signal transduction systems	86
5 Recent developments, summary, and outlook	90
Acknowledgments.....	91
References	91
Mesoscopic kinetics and its applications in protein synthesis.....	95
Johan Elf, Johan Paulsson, Otto Berg, and Måns Ehrenberg	95
Abstract	95
1 Introduction	95
2 Chemical reactions in the living cell	96
3 Mesoscopic kinetics for homogenous systems	97
3.1 The master equation.....	97
3.2 Monte Carlo simulations of system trajectories.....	99
3.3 The Fokker-Planck Approximation	99
3.4 The Linear Noise Approximation	100
4 A master equation with an analytical solution	102

5 Stoichiometrically coupled flows	103
6 Stoichiometrically coupled flows in protein synthesis	108
7 Near-critical fluctuations in the levels of charged tRNA isoacceptors...	109
8 Conclusions	114
9 Appendix: The moment generating function.....	114
References	116
What is systems biology? From genes to function and back.....	119
Hans V. Westerhoff and Jan-Hendrik S. Hofmeyr	119
Abstract	119
1 What came before?.....	119
1.1. Physiology	119
1.2 Molecular biology.....	120
1.3 Systems molecular biology?	121
2 Limits to systems molecular biology.....	122
2.1 Data floods.....	122
2.2 Nonlinearity	122
2.3 Nonlinearities and dependencies prevail in real life	124
3 Systems biology: Neither the biology of systems nor the biology of all molecules individually	126
4 Systems biology <i>avant la lettre</i>	127
4.1 Self-organization.....	127
4.2 Perpetuation	129
4.3 Chemiosmotic coupling	129
4.4 Non-equilibrium thermodynamics	130
4.5 Systems biology <i>avant la lettre</i> : Metabolic Control Analysis; laws of systems biology	130
4.6 Circular causality and emergence	132
4.7 Networks and hierarchies in life	135
4.8 Systems biology: dealing with the circular causation in biology....	138
5 Concluding remarks	140

Mechanistic and modular approaches to modeling and inference of cellular regulatory networks	143
Boris N. Kholodenko, Frank J. Bruggeman, and Herbert M. Sauro	143
Abstract	143
1 From molecular to systems biology	143
2 Network inference	144
2.1 Modular or top-down approach and the quantification of the network architecture by “connection” coefficients	144
2.2 Modularization of cellular networks.....	146
2.3 Inference of connections between network modules	148
3 Bottom-up approach.....	149
3.1 Spatio-temporal patterns of growth factor signaling and cell fate decisions	149

3.2 Differential temporal patterns of signaling responses can be explained using kinetic modeling	150
3.3 Membrane translocation of SOS and RasGAP shapes Ras activation patterns	152
3.4 Heterogeneous spatial distribution is an additional factor controlling signaling cascades	153
4 Rationalization of network function	153
5 Outlook: The future of systems biology	155

METABOLISM

Modeling the *E. coli* cell: The need for computing, cooperation, and consortia

Barry L. Wanner, Andrew Finney, Michael Hucka	163
Abstract	163
1 Introduction	163
2 Quantitative, formal models are essential instruments in systems biology	165
2.1 Computational modeling is an extension of the scientific method	166
2.2 Mechanistic models can serve as frameworks for organizing data and hypotheses	167
3 A variety of software resources are available today for computational modeling	168
4 Exchanging models between software tools: The Systems Biology Markup Language	172
4.1 The general form of SBML	173
4.2 The continued evolution of SBML	174
5 Development of an <i>E. coli</i> systems biology project	176
6 An integrated <i>E. coli</i> database for community research and systems biology	179
7 Putting models to work: The International <i>E. coli</i> Alliance	183

SIGNAL TRANSDUCTION

Mathematical modelling of the Wnt-pathway	259
Reinhart Heinrich	259
Abstract	259
1 Introduction	259
2 Detailed reaction scheme	261
3 Systems equations	261
4 Model reference state	263
5 The stimulated state	265
6 Comparison of theory and experiment	266
7 Effect of APC on the β -catenin concentration	268
8 Transient stimulation of the pathway	268
9 Control and robustness of the Wnt-pathway	270
10 Discussion	274
References	275
 Modelling signalling pathways - a yeast approach	277
Bodil Nordlander, Edda Klipp, Bente Kofahl, Stefan Hohmann	277
Abstract	277
1 Introduction	277
2 Yeast MAPK pathways	278
3 The yeast pheromone response pathway	279
3.1 Simulating feedback control mechanisms of the pheromone response pathway	281
4 The high osmolarity glycerol response pathway	286
4.1 Feedback control of the HOG pathway	288
5 Feedback control with and without pathway desensitisation	292
6 Data for modelling	293
7 Mathematical models	297
8 Conclusions	298
Acknowledgements	298

CELL LIFE AND DEATH

Systems biology of the yeast cell cycle engine	305
Béla Novák, Katherine C. Chen, and John J. Tyson	305
Abstract	305
1 Introduction	305
2 Components of the cell cycle engine	306
3 Feedback loops and regulatory modules	309
4 Mathematical formulation	311
5 The role of the nucleocytoplasmic ratio	311
6 Bifurcation diagrams and their biological significance	312

7 Cell cycle progression on the bifurcation diagram	315
8 Effects of cell cycle checkpoints on the bifurcation diagrams	316
9 Endoreplication cycles	318
10 Conclusion.....	319
Acknowledgements	320
References	320
Abbreviations	322
Supplement: balance equations	323
A modular systems biology analysis of cell cycle entrance into S-phase.....	325
Lilia Alberghina, Riccardo L. Rossi, Danilo Porro, and Marco Vanoni.....	325
Abstract	325
1 Systems biology and complex cellular processes.....	325
2 The modular systems biology approach	326
3 The control of cell cycle: an open question.....	328
3.1 Cyclins, Cdk, and Cki are the evolutionary conserved molecular machines driving the cell cycle	329
4 Global functional analysis of the G1/S transition in budding yeast.....	331
4.1 Coordination between growth and the DNA division cycle: size distribution is a distinctive property of a yeast population	332
4.2 Are metabolism and DNA division cycle coordinated?.....	333
4.3 Analysis of a shift-up.....	333
5 A new threshold control for the G1 to S transition in budding yeast	335
6 Post-genomic analysis of the G1/S transition.....	338
7 What next?	341
Acknowledgements	342
References	342

Systems biology of apoptosis.....	349
Martin Bentele and Roland Eils.....	349
Abstract	349
1 Systems biology: paradigm shift from reductionism to holism in biology? The whole is greater than the sum of its parts	349
2 Modelling signal transduction networks.....	350
3 CD95-induced apoptosis	351
3.1 The CD95-receptor and the DISC.....	352
3.2 The caspase cascade.....	352
3.3 Type I versus type II cells and the regulation of apoptosis	352
4 Mathematical models of apoptosis	353
5 Structured information models - The information problem.....	354
5.1 Network decomposition based on information quality	355
5.2 Combined model definition	355
5.3 The model of CD95-induced apoptosis	356
5.4 Black boxes.....	357
5.5 Experimental data	357

6 Model reduction by sensitivity analysis	357
6.1 The sensitivity matrix	358
6.2 Local versus global sensitivity analysis	360
6.3 Stochastic approach to global sensitivity analysis	360
6.4 Sensitivity of sensitivities	362
7 Sensitivity-controlled parameter estimation	363
7.1 Cluster-based parameter estimation	363
7.2 Parameter estimation algorithm	365
8 Model simulation of apoptosis and experimental results	366
8.1 Parameter estimation based on multiple scenarios	366
8.2 Threshold mechanism for CD95-induced apoptosis	367
8.3 Delay of apoptosis and point of no return	367
9 Outlook	368
References	370
Scientific and technical challenges for systems biology	373
