
Contents

1	Introduction	1
1.1	Relevant Length Scales	1
1.2	Diffusive Transport	2
1.3	Coherent Backscattering and the Approach to Localization	3
1.4	Sample Size Dependence	4
1.5	Localization and Scaling	6
1.6	Spatial Dimensionality in Localization and Diffusion	8
1.7	Mesoscopic Phenomena	11
1.8	Localization vs. Confinement	13
1.9	Topics not Covered	13
2	Quantum and Classical Waves	15
2.1	Preliminaries	15
2.1.1	Quantum and Classical Wave Equations	16
2.2	Green Functions for Waves in a Uniform Medium	18
2.2.1	Green Function for the Uniform Medium	19
2.2.2	Green Function and the Density of States	21
2.2.3	Real Space Green Functions	23
2.3	Waves on a Discrete Lattice	24
2.3.1	Dispersion Relation	24
2.3.2	Random Discrete Lattices: the Anderson Model	28
2.4	Lattice Green Functions	29
2.4.1	1D Lattice Green Function	30
2.4.2	2D Lattice Green Function	32
2.4.3	3D Lattice Green Function	33
2.5	Treating Continuum Problems on a Lattice	34
2.6	Problems and Solutions	36
3	Wave Scattering and the Coherent Potential Approximation	45
3.1	An Overview of the Approach	45

3.1.1	Information from the First Moment	46
3.1.2	Information from the Second Moment	46
3.1.3	Information from Higher Moments	46
3.2	Wave Scattering Formalism	47
3.2.1	The Operator Notation	48
3.2.2	The T Operator	49
3.2.3	Configurational Averaging	50
3.2.4	The Self-Energy	50
3.3	Single Scatterer: the Lattice Case	51
3.3.1	Impurity Bound State	52
3.4	Single Scatterer: the Continuum Case	53
3.4.1	Wave Function in the Single Scatterer Case	55
3.4.2	A Digression on Notation	55
3.4.3	Scattering Amplitude and the t Operator	56
3.4.4	Scattering Amplitude and the Optical Theorem: 3D Case	57
3.4.5	Scattering Amplitude and the Optical Theorem: 2D Case	58
3.4.6	Scattering Amplitude and the Optical Theorem: 1D Case	59
3.5	Infinite Number of Scatterers: the Effective Medium	60
3.5.1	Meaning of a k-Independent Self Energy	60
3.5.2	The Mean Free Path	60
3.5.3	The Coherent Potential Approximation (CPA)	61
3.6	Accuracy of the CPA	62
4	Coherent Waves and Effective Media	75
4.1	Coherence and Homogenization	75
4.2	CPA: The Anderson Model	76
4.2.1	Efficient Green Function Evaluation from DOS	78
4.3	CPA: The Classical Waves	80
4.3.1	The Role of Microstructure	81
4.3.2	The Symmetric Microstructure	83
4.3.3	The Dispersion Microstructure	88
4.4	Effective Medium Modeling of Inhomogeneous Materials	92
4.4.1	Granular Metals	92
4.4.2	Sedimentary Rocks	94
4.5	The Spectral Function Approach: Coherent Quasimodes	102
4.5.1	Formulation	104
4.5.2	Coherent Acoustic Waves in the Intermediate Wavelength Regime	106
4.5.3	Novel Acoustic Modes in Colloidal Suspensions	108
4.5.4	Group Velocity in Strongly Scattering Media	112
4.5.5	Accuracy of the Spectral Function Approach	116

5	Diffusive Waves	127
5.1	Beyond the Coherent Regime	127
5.2	Pulse Intensity Evolution in a Random Medium	128
5.3	The Bethe-Salpeter Equation and its Solution by Moments	131
5.3.1	Notations	132
5.3.2	Irreducible Vertex Function and the Bethe-Salpeter Equation	134
5.3.3	Diffusive Behavior from a Simplified Model	136
5.3.4	The Ward Identity in the Simplified Model	137
5.3.5	Formal Derivation of the Diffusive Pole and the Diffusion Constant	139
5.3.6	Higher Moment of the Transport Equation	140
5.3.7	Expansion of $\phi_{\mathbf{k}}$	141
5.3.8	Solution for the Diffusive Pole and the Diffusion Constant	143
5.3.9	Configurational Averaging and Dissipation	145
5.4	The Vertex Function	146
5.4.1	The Reducible Vertex and Diagrammatic Representations	146
5.4.2	CPA for Γ : the Ladder Diagrams and the Irreducible Vertex	147
5.4.3	Irreducible Vertex: the Anderson Model	150
5.4.4	Irreducible Vertex: Classical Waves	152
5.5	The Ward Identity	155
5.5.1	Cancellation of the Impurity Scattering Terms	157
5.5.2	Reduction to the Simplified Model	159
5.5.3	Meaning of the Ward Identity	160
5.6	Diffusion Constant Modification for Classical Waves	160
5.7	Evaluation of the Wave Diffusion Constant	162
5.7.1	Quantum Case: the Anderson Model	162
5.7.2	Classical Wave Diffusion Constant	165
5.7.3	Anisotropic Scattering and the Transport Mean Free Path	167
5.8	Application: Diffusive Wave Spectroscopy	168
5.8.1	The Siegert Relation	168
5.8.2	Averaging Over the Diffusive Motion of Scatterers	170
5.8.3	Averaging Over the Scattering Angles	170
5.8.4	Diffusive Transport of Waves	171
5.8.5	Boundary Conditions for Diffusive Light Flux	173
5.8.6	Solutions for the Slab Geometry	174
6	The Coherent Backscattering Effect	183
6.1	Wave Diffusion versus Classical Diffusion	183
6.2	Coherence in the Backscattering Direction	184
6.2.1	Time Reversal Invariance	185

6.3	Angular Profile of the Coherent Backscattering	186
6.3.1	Single Configuration and Configurational Averaging	187
6.3.2	Counting the Scattering Paths	188
6.3.3	Backscattering from a Random Half Space	188
6.3.4	Features of the Coherent Backscattering Peak	189
6.3.5	Backscattering from a Finite Thickness Slab	190
6.4	Sample Size (Path Length) Dependence	191
6.4.1	Effect of Absorption	194
7	Renormalized Diffusion	199
7.1	Coherent Backscattering Effect in the Diagrammatic Representation	199
7.2	Evaluation of the Maximally Crossed Diagrams	201
7.2.1	Momenta Transformations	201
7.2.2	Summation of Maximally Crossed Diagrams	203
7.3	Renormalized Diffusion Constant	204
7.4	Sample Size and Spatial Dimensionality Dependencies of Wave Diffusion	206
7.4.1	Conductivity Correction	206
7.4.2	Diffusion Constant Correction	206
7.4.3	The Emergence of Localization Length	207
7.4.4	Localization in 3D : the Ioffe – Regel Criterion	207
7.5	Localization in One Dimension:	
	the Herbert–Jones–Thouless Formula	208
7.5.1	Localization and Intensity Transmission	208
7.5.2	Fluctuations in Intensity Transmission	209
7.5.3	Randomness is not Always a Sufficient Condition for 1D Localization	210
7.5.4	Localization and Eigenfunctions in 1D: the Characteristic Function	210
7.5.5	Relation Between the 1D Localization Length and Density of States	211
7.5.6	HJT Formula for the 1D Anderson Model	212
7.5.7	HJT Formula for 1D Classical Scalar Waves	212
7.5.8	High Frequency and Low Frequency Limiting Behaviors	214
8	The Scaling Theory of Localization	219
8.1	Distinguishing a Localized State from an Extended State	219
8.1.1	The Scaling Argument and Spatial Dimensionality	220
8.1.2	Dimensionless Conductance	221
8.2	The Scaling Hypothesis and Its Consequences	222
8.2.1	Defining the Scaling Function	223
8.2.2	Scaling and the Effect of Randomness	223
8.2.3	Behavior of the Scaling Function	224

8.2.4	When System Size is Less than the Localization Length	225
8.2.5	Wave Transport Near the 3D Mobility Edge	226
8.2.6	Anomalous Diffusion and the Minimum Metallic Conductance in 3D	227
8.2.7	Scaling Behavior in the 3D Localized Regime	228
8.3	Numerical Evaluation of the Scaling Function	229
8.3.1	The Finite-Size Scaling Function	230
8.3.2	Limiting Behaviors	230
8.3.3	Relation to the Scaling Functions in 1D, 2D, and 3D	231
8.4	Universality and Limitations of the Scaling Theory Results . . .	235
8.4.1	Localization in 3D : Lattice vs. Continuum	236
8.4.2	Implicit Assumptions of the Scaling Theory	236
9	Localized States and the Approach to Localization	243
9.1	The Self-Consistent Theory of Localization	243
9.1.1	Transition to the Strong Scattering Regime	243
9.1.2	Response of the Localized State at Finite Modulation Frequency	244
9.1.3	Qualitative Evaluation of the Correction Term	245
9.2	Localization Behavior of the Anderson Model	246
9.2.1	Evaluation of the Maximally Crossed Diagrams' Contribution	247
9.2.2	Mobility Edge in 3D Anderson Model	249
9.2.3	Localization Length and Correlation Length in the 3D Anderson Model	251
9.2.4	2D Anderson Model	252
9.2.5	Localization Length in the 2D Anderson Model	254
9.2.6	1D Anderson Model	256
9.2.7	Localization Length in the 1D Anderson Model	257
9.2.8	Input Parameters to Localization Calculations	257
9.3	Classical Scalar Wave Localization	257
9.3.1	One Parameter Criterion for the Classical Wave 3D Mobility Edge	259
9.3.2	Input Parameter Values and Wave Scattering Regimes	261
9.3.3	Scattering and Localization of Classical Waves in 3D . . .	262
9.3.4	Periodicity in Scattering Structures and 3D Localization	263
9.3.5	Localization of 2D Classical Scalar Wave	265
9.3.6	Localization of 1D Classical Scalar Wave	266
9.4	Transport Velocity of Classical Scalar Waves	267
9.4.1	Transport Velocity and Scattering Resonances	268
9.4.2	Effective Medium Based on Energy Homogenization . . .	268

9.5	The Scaling Function Evaluation	270
9.5.1	Finite Size Modification of the Diffusion Constant	271
9.5.2	Finite Size Effect for Density of States	271
9.5.3	Scaling Function and its Limiting Behaviors	273
10	Localization Phenomena in Electronic Systems	281
10.1	Finite Temperatures and the Effect of Inelastic Scattering	281
10.1.1	Inelastic Scattering in the Classical Wave Case	281
10.1.2	Inelastic Scattering in the Electronic Case	282
10.2	Temperature Dependence of the Resistance	
	in 2D Disordered Films	282
10.2.1	Manifestation of Localization Correction	
	in 2D Conductivity	283
10.3	Magnetoresistance of Disordered Metallic Films	284
10.3.1	Effect of a Magnetic Field	285
10.3.2	Magnetic Field Correction to the Coherent	
	Backscattering Effect	286
10.3.3	Thick Film Case	286
10.3.4	Thin Film Case	287
10.3.5	Diffusion and Inelastic Relaxation	287
10.3.6	Magnetoresistance and the Distance to Localization	288
10.3.7	Spin-Orbit Coupling	289
10.4	Transport of Localized States at Finite Temperatures:	
	Hopping Conduction	290
10.4.1	Constructing the Critical Percolating Path	
	of Least Resistance	291
10.4.2	Temperature Dependence of the Critical	
	Path Conductance	292
10.4.3	Variable Range Hopping	293
11	Mesoscopic Phenomena	297
11.1	What is “Mesoscopic”?	297
11.1.1	Dissipation and Mesoscopic Conductance	297
11.2	Intensity Distribution of the Speckle Pattern	298
11.2.1	Statistical Independence and Gaussian Distribution	299
11.3	Correlations in the Diffusive Intensity	300
11.3.1	Frequency Correlation of the Diffusive Intensity	301
11.3.2	Spatial Correlation in the Diffusive Intensity	302
11.3.3	Intensity Fluctuations for Classical Waves in 3D	304
11.4	Long-Range Correlation in Intensity Fluctuations	306
11.4.1	Reduction to a Diffusion Problem	
	with Random Sources	306
11.4.2	Solution in the Slab Geometry	307
11.4.3	Slow Decay of Transmitted Intensity Fluctuations	309
11.5	Landauer Formula and Quantized Conductance	310

11.5.1 Quantized Conductance	311
11.5.2 Two-Terminal versus Four-Terminal	311
11.5.3 The Single Channel (1D) Case	312
11.5.4 Landauer–Buttiker Formula for the Multichannel Case	314
11.6 Characteristics of Mesoscopic Conductance	315
11.6.1 Disordered 2D Metallic Film	315
11.6.2 Distribution of the Dimensionless Conductances	316
11.6.3 Localization Length, Conductance Fluctuations and Transport Regimes	317
11.6.4 Heuristic Explanation of Universal Conductance Fluctuations	319
References	323
Index	331

Introduction to Wave Scattering, Localization and
Mesoscopic Phenomena

Sheng, P.

2006, XV, 329 p., Hardcover

ISBN: 978-3-540-29155-8
