

Contents

1	Random-Cluster Measures	1
1.1	Introduction	1
1.2	Random-cluster model	4
1.3	Ising and Potts models	6
1.4	Random-cluster and Ising/Potts models coupled	8
1.5	The limit as $q \downarrow 0$	13
1.6	Basic notation	15
2	Monotonic Measures	19
2.1	Stochastic ordering of measures	19
2.2	Positive association	25
2.3	Influence for monotonic measures	30
2.4	Sharp thresholds for increasing events	33
2.5	Exponential steepness	35
3	Fundamental Properties	37
3.1	Conditional probabilities	37
3.2	Positive association	39
3.3	Differential formulae and sharp thresholds	40
3.4	Comparison inequalities	43
3.5	Exponential steepness	49
3.6	Partition functions	53
3.7	Domination by the Ising model	57
3.8	Series and parallel laws	61
3.9	Negative association	63
4	Infinite-Volume Measures	67
4.1	Infinite graphs	67
4.2	Boundary conditions	70
4.3	Infinite-volume weak limits	72
4.4	Infinite-volume random-cluster measures	78
4.5	Uniqueness via convexity of pressure	85
4.6	Potts and random-cluster models on infinite graphs	95

5	Phase Transition	98
5.1	The critical point	98
5.2	Percolation probabilities	102
5.3	Uniqueness of random-cluster measures	107
5.4	The subcritical phase	110
5.5	Exponential decay of radius	113
5.6	Exponential decay of volume	119
5.7	The supercritical phase and the Wulff crystal	122
5.8	Uniqueness when $q < 1$	131
6	In Two Dimensions	133
6.1	Planar duality	133
6.2	The value of the critical point	138
6.3	Exponential decay of radius	143
6.4	First-order phase transition	144
6.5	General lattices in two dimensions	152
6.6	Square, triangular, and hexagonal lattices	154
6.7	Stochastic Löwner evolutions	164
7	Duality in Higher Dimensions	167
7.1	Surfaces and plaquettes	167
7.2	Basic properties of surfaces	169
7.3	A contour representation	173
7.4	Polymer models	179
7.5	Discontinuous phase transition for large q	182
7.6	Dobrushin interfaces	195
7.7	Probabilistic and geometric preliminaries	199
7.8	The law of the interface	202
7.9	Geometry of interfaces	208
7.10	Exponential bounds for group probabilities	215
7.11	Localization of interface	218
8	Dynamics of Random-Cluster Models	222
8.1	Time-evolution of the random-cluster model	222
8.2	Glauber dynamics	224
8.3	Gibbs sampler	225
8.4	Coupling from the past	227
8.5	Swendsen–Wang dynamics	230
8.6	Coupled dynamics on a finite graph	232
8.7	Box dynamics with boundary conditions	237
8.8	Coupled dynamics on the infinite lattice	240
8.9	Simultaneous uniqueness	255

9	Flows in Poisson Graphs	257
9.1	Potts models and flows	257
9.2	Flows in the Ising model	262
9.3	Exponential decay for the Ising model	273
9.4	The Ising model in four and more dimensions	274
10	On Other Graphs	276
10.1	Mean-field theory	276
10.2	On complete graphs	277
10.3	Main results for the complete graph	281
10.4	The fundamental proposition	284
10.5	The size of the largest component	286
10.6	Proofs of main results for complete graphs	289
10.7	The nature of the singularity	295
10.8	Large deviations	296
10.9	On a tree	299
10.10	The critical point for a tree	305
10.11	(Non-)uniqueness of measures on trees	313
10.12	On non-amenable graphs	315
11	Graphical Methods for Spin Systems	320
11.1	Random-cluster representations	320
11.2	The Potts model	321
11.3	The Ashkin–Teller model	326
11.4	The disordered Potts ferromagnet	330
11.5	The Edwards–Anderson spin-glass model	333
11.6	The Widom–Rowlinson lattice gas	337
	Appendix. The Origins of FK(G)	341
	List of Notation	350
	References	353
	Index	373

The Random-Cluster Model

Grimmett, G.R.

2006, XIII, 378 p., Hardcover

ISBN: 978-3-540-32890-2
