Part I Problems with multiple scales

From discrete systems to continuous variational problems: an introduction

<i>Andrea Braides and Maria Stella Gelli</i>	3
1 Discrete problems with limit energies defined on Sobolev spaces	6
1.1 Discrete functionals	6
1.2 Equivalent energies on Sobolev functions	7
1.3 Convex energies	8
1.4 Non-convex energies with superlinear growth	11
1.5 A general convergence theorem	19
1.6 Convergence of minimum problems	21
1.7 More examples	28
1.8 Energies depending on second-difference quotients	35
2 Limit energies on discontinuous functions: two examples	36
2.1 The Blake-Zisserman model	36
2.2 Second-difference interactions	51
2.3 Lennard-Jones potentials	52
2.4 Renormalization-group approach	58
3 General convergence results	58
3.1 Functions of bounded variation	58
3.2 Nearest-neighbour interactions	60
3.3 Long-range interactions	73
References	75

Relaxation for bulk and interfacial energies

<i>Anneliese Defranceschi</i>	79
1 Introduction	79
2 Lower semicontinuity - The direct method of the Calculus of Variations	81
3 Relaxation	83

VIII Contents

4	Preliminaries. Functions of bounded variation and special functions of bounded variation	85
4.1	Notation	85
4.2	Measure spaces	86
4.3	Functions of bounded variation	88
4.4	Sets of finite perimeter	90
4.5	Structure of BV functions. Approximate discontinuity points and approximate jump points	91
4.6	Special functions of bounded variation	92
4.7	BV (SBV) functions in one dimension	92
5	Lower semicontinuity and relaxation in one dimension	93
5.1	A characterization of l.s.c. for functionals defined on $SBV(I)$. Relaxation on $BV(I)$	93
5.2	A sufficient condition for l.s.c. for functionals defined on $SBV(I)$. Relaxation in $BV(I)$	100
6	Lower semicontinuity and relaxation in higher dimension	106
7	Lower semicontinuity and relaxation in higher dimension and for vector-valued functions	113
7.1	Upper bound for the relaxed functional	119
7.2	De Giorgi-Letta criterion to prove measure properties of the relaxed functional	121
7.3	Integral representation	125
7.4	Proof of the main theorem	126
8	Relaxation in higher dimension (isotropy assumptions)	129
9	Appendix	132
9.1	Appendix A: Lower semicontinuous envelope	132
9.2	Appendix B: Proof of (73)	135
9.3	Appendix C: Proof of Step 3 in Proposition 67	135
	References	136

Convergence of Dirichlet forms on fractals

	<i>Roberto Peirone</i>	139
1	Introduction	139
2	Construction of an energy on the Gasket	141
3	Dirichlet forms on finitely ramified fractals	152
4	Main properties of renormalization and harmonic extension	164
5	Homogenization on the Gasket	173
6	Homogenization on general fractals	179
	References	188

Homogenization in perforated domains

	<i>Gregory A. Chechkin</i>	189
1	Appearance of a “term etrange”. Dirichlet problems in domains with low concentration of holes	190
1.1	Basic notation and setting of the problem	190

1.2	The homogenization theorem	191
2	Homogenization problems in perforated domain with oscillating Fourier boundary conditions	193
2.1	Basic notation	193
2.2	Formal asymptotic analysis of the problem	194
2.3	Main estimates and results.	197
2.4	Auxiliary results	199
2.5	Justification of asymptotics	203
	References	207

Homogenization of random non stationary parabolic operators

	<i>Andrey Piatnitski</i>	209
1	The setup	210
2	Factorization of the equation	213
3	A priori estimates for the factorized equation	214
4	Auxiliary problems	215
5	Homogenization of the factorized equation	218
6	Homogenization of the original equation	223
7	Equations with diffusion driving process	225
	References	230

Part II Problems with concentration

Γ -convergence for concentration problems

	<i>Adriana Garroni</i>	233
1	Introduction	233
2	Two classical examples	234
2.1	Sobolev inequality	235
2.2	Capacity and isoperimetric inequality for the capacity	238
3	The general problem	242
3.1	Variational formulation	242
3.2	Generalized Sobolev inequality	244
3.3	Concentration	244
3.4	Γ^+ -convergence	245
3.5	The concentration result in terms of Γ^+ -convergence	246
4	Identification of the concentration point	252
4.1	The Green's function and the Robin function	253
4.2	Asymptotic expansion in Γ^+ -convergence	256
4.3	The result	257
4.4	Harmonic transplantation	260
5	Irregular domains	263
	References	265

Gamma-convergence of gradient flows and applications to Ginzburg-Landau vortex dynamics

<i>Sylvia Serfaty</i>	267
1 Introduction	267
1.1 Presentation of the Ginzburg-Landau model.....	267
1.2 Gamma-convergence	269
1.3 Γ -convergence of Ginzburg-Landau	271
2 The abstract result for Γ -convergence of gradient-flows	275
2.1 The abstract situation	275
2.2 The result	276
2.3 Interpretation	279
2.4 Idea of the proof.....	279
2.5 Application to Ginzburg-Landau	281
2.6 Remarks.....	282
3 Proof of the additional conditions for Ginzburg-Landau	284
3.1 A product-estimate for Ginzburg-Landau	284
3.2 Idea of the proof.....	285
3.3 Application to the dynamics	286
3.4 Proof of the construction 2')	287
4 Extensions of the method	289
4.1 Collisions	289
4.2 Second order questions - stability issues	290
References	291

PDE analysis of concentrating energies for the Ginzburg-Landau equation

<i>Didier Smets</i>	293
1 Introduction	293
2 The monotonicity formula	294
2.1 Scaling properties	294
2.2 The monotonicity formula	295
2.3 Consequences for μ_*	297
3 Regularity theorems for $(GL)_\varepsilon$	299
3.1 Bochner, small energy regularity and clearing-out	299
3.2 Consequences for μ_*	306
4 Potential and modulus estimates	308
5 Σ_μ is a minimal surface	311
5.1 Classical and weak notions of mean curvature	311
5.2 Deriving the curvature equation	312
References	314
