

Contents

1	Introduction	1
1.1	Plasticity and Thermodynamics.....	1
1.1.1	Purpose of this Book	1
1.1.2	Advantages of Our Approach	2
1.1.3	Generality	2
1.1.4	Ziegler's Orthogonality Condition	3
1.1.5	Constitutive Models.....	4
1.2	Context of this Book	4
1.3	Notation	5
1.4	Some Basic Continuum Mechanics.....	6
1.4.1	Small Deformations and Small Strains.....	6
1.4.2	Sign Convention.....	8
1.5	Equations of Continuum Mechanics	8
1.5.1	Equilibrium	9
1.5.2	Compatibility	9
1.5.3	Initial and Boundary Conditions	9
1.5.4	Work Conjugacy	10
1.5.5	Numbers of Variables and Equations	11
2	Classical Elasticity and Plasticity	13
2.1	Elasticity	13
2.2	Basic Concepts of Plasticity Theory	16
2.3	Incremental Stiffness in Plasticity Models	19
2.3.1	Perfect Plasticity	20
2.3.2	Hardening Plasticity.....	22
2.3.3	Isotropic Hardening.....	25
2.3.4	Kinematic Hardening.....	27
2.3.5	Discussion of Hardening Laws	28
2.4	Frictional Plasticity.....	28

2.5	Restrictions on Plasticity Theories.....	30
2.5.1	Drucker's Stability Postulate.....	31
2.5.2	Il'iushin's Postulate of Plasticity.....	32
3	Thermodynamics	35
3.1	Classical Thermodynamics	35
3.1.1	Introduction.....	35
3.1.2	The First Law.....	36
3.1.3	The Second Law	38
3.2	Thermodynamics of Fluids.....	40
3.2.1	Energy Functions	42
3.2.2	An Example of an Internal Energy Function	43
3.2.3	Perfect Gases	44
3.3	Thermomechanics of Continua.....	47
3.3.1	Terminology.....	47
3.3.2	Thermoelasticity	48
3.3.3	Internal Variables and Dissipation	49
4	The Hyperplastic Formalism	53
4.1	Introduction	53
4.2	Internal Variables and Generalised Stress.....	53
4.3	Dissipation and Dissipative Generalised Stress.....	54
4.3.1	The Laws of Thermodynamics	54
4.3.2	Dissipation Function	55
4.3.3	Dissipative Generalised Stress.....	56
4.4	Yield Surface.....	56
4.4.1	Definition.....	56
4.4.2	The Flow Rule.....	57
4.4.3	Convexity.....	58
4.4.4	Uniqueness of the Yield Function	58
4.5	Transformations from Internal Variable to Generalised Stress	59
4.6	A Complete Formulation	59
4.7	Incremental Response.....	62
4.8	Isothermal and Adiabatic Conditions.....	66
4.9	Plastic Strains	67
4.10	Yield Surface in Stress Space	68
4.11	Conversions Between Potentials	69
4.11.1	Entropy and Temperature	69
4.11.2	Stress and Strain	70
4.11.3	Internal Variable and Generalised Stress	70
4.11.4	Dissipation Function to Yield Function	70
4.11.5	Yield Function to Dissipation Function	71

4.12	Constraints	71
4.12.1	Constraints on Strains.....	72
4.12.2	Constraints on Plastic Strain Rates	73
4.13	Advantages of Hyperplasticity	74
4.14	Summary	74
5	Elastic and Plastic Models in Hyperplasticity.....	77
5.1	Elasticity and Thermoelasticity.....	77
5.1.1	One-dimensional Elasticity.....	77
5.1.2	Isotropic Elasticity.....	78
5.1.3	Incompressible Elasticity	78
5.1.4	Isotropic Thermoelasticity.....	79
5.1.5	Hierarchy of Isotropic Elastic Models	80
5.2	Perfect Elastoplasticity	81
5.2.1	One-dimensional Elastoplasticity	81
5.2.2	Von Mises Elastoplasticity.....	83
5.2.3	Rigid-plastic Models.....	84
5.3	Frictional Plasticity and Non-associated Flow.....	84
5.3.1	A Two-dimensional Model	85
5.3.2	Dilation	86
5.3.3	The Drucker-Prager Model with Non-associated Flow	87
5.4	Strain Hardening	88
5.4.1	Theory of Strain-hardening Hyperplasticity.....	88
5.4.2	Isotropic Hardening.....	91
5.4.3	Kinematic Hardening.....	96
5.4.4	Mixed Hardening.....	101
5.5	Hierarchy of Plastic Models.....	102
6	Advanced Plasticity Theories.....	105
6.1	Developments of Classical Plasticity Theory	105
6.2	Bounding Surface Plasticity.....	105
6.3	Nested Surface Plasticity	107
6.4	Multiple Surface Plasticity	110
6.5	Remarks on the Intersection of Yield Surfaces.....	112
6.5.1	The Non-intersection Condition.....	112
6.5.2	Example of Intersecting Surfaces	112
6.5.3	What Occurs when the Surfaces Intersect?	115
6.6	Alternative Approaches to Material Non-linearity	117
6.7	Comparison of Advanced Plasticity Models	118
7	Multisurface Hyperplasticity	119
7.1	Motivation	119
7.2	Multiple Internal Variables.....	120

7.3	Kinematic Hardening with Multiple Yield Surfaces.....	121
7.3.1	Potential Functions.....	121
7.3.2	Link to Conventional Plasticity	121
7.3.3	Incremental Response	123
7.4	One-dimensional Example (the Iwan Model)	125
7.5	Multidimensional Example (von Mises Yield Surfaces)	128
7.6	Summary	131
8	Continuous Hyperplasticity	133
8.1	Generalised Thermodynamics and Rational Mechanics	133
8.2	Internal Functions	134
8.3	Energy and Dissipation Functionals	134
8.3.1	Energy Functional.....	134
8.3.2	Generalised Stress Function	135
8.3.3	Dissipation Functional.....	136
8.3.4	Dissipative Generalised Stress Function.....	136
8.4	Legendre Transformations of the Functionals	137
8.4.1	Legendre Transformations of the Energy Functional	137
8.4.2	Legendre Transformation of the Dissipation Functional.....	138
8.5	Incremental Response	138
8.6	Kinematic Hardening with Infinitely Many Yield Surfaces.....	142
8.6.1	Potential Functionals.....	142
8.6.2	Link to Conventional Plasticity	143
8.6.3	Incremental Response	145
8.7	Example: One-dimensional Continuous Hyperplastic Model.....	146
8.8	Calibration of Continuous Kinematic Hardening Models.....	148
8.9	Example: Calibration of the Weighting Function.....	148
8.9.1	Formulation of the One-dimensional Model	148
8.9.2	Analogy with the Extended Iwan's Model	149
8.9.3	Model Calibration Using the Initial Loading Curve.....	150
8.9.4	Unloading Behaviour	151
8.10	Example: Calibration of the Plastic Modulus Function	151
8.10.1	Formulation of the Multidimensional von Mises Model	151
8.10.2	Model Calibration Using the Initial Loading Curve.....	154
8.10.3	Analogy with an Advanced Plasticity Model.....	155
8.11	Hierarchy of Multisurface and Continuous Models.....	155
9	Applications in Geomechanics: Elasticity and Small Strains	159
9.1	Special Features of Mechanical Behaviour of Soils.....	159
9.2	Sign Convention and Triaxial Variables.....	159
9.3	Effective Stresses	160

9.4	Dependence of Stiffness on Pressure	162
9.4.1	Linear and Non-linear Isotropic Hyperelasticity	163
9.4.2	Proposed Hyperelastic Potential	167
9.4.3	Elastic-plastic Coupling in Clays	172
9.4.4	Effects of Elasticity on Plastic Behaviour	175
9.5	Small Strain Plasticity, Non-linearity, and Anisotropy	176
9.5.1	Continuous Hyperplastic Form of a Small Strain Model	177
9.5.2	Derivation of the Model from Potential Functions	178
9.5.3	Behaviour of the Model During Initial Proportional Loading	180
9.5.4	Behaviour of the Model During Proportional Cyclic Loading	184
9.5.5	Concluding Remarks	186
10	Applications in Geomechanics: Plasticity and Friction	187
10.1	Critical State Models	187
10.1.1	Hyperplastic Formulation of Modified Cam-Clay	187
10.1.2	Non-uniqueness of the Energy Functions	190
10.2	Towards Unified Soil Models	191
10.2.1	Small Strain Non-linearity: Hyperbolic Stress-strain Law	191
10.2.2	Modified Forms of the Energy Functionals	193
10.2.3	Combining Small-strain and Critical State Behaviour	195
10.2.4	Examples	198
10.2.5	Continuous Hyperplastic Modified Cam-Clay	203
10.3	Frictional Behaviour and Non-associated Flow	204
10.3.1	The Dissipation to Yield Surface Transformation	205
10.3.2	The Yield Surface to Dissipation Transformation	207
10.3.3	Tensorial Form	209
10.4	Further Applications of Hyperplasticity in Geomechanics	209
11	Rate Effects	211
11.1	Theoretical Background	211
11.1.1	Preliminaries	211
11.1.2	The Force Potential and the Flow Potential	213
11.1.3	Incremental Response	215
11.2	Examples	216
11.2.1	One-dimensional Model with Additive Viscous Term	216
11.2.2	A Non-linear Viscosity Model	219
11.2.3	Rate Process Theory	221
11.2.4	A Continuum Model	223

11.3	Models with Multiple Internal Variables.....	224
11.3.1	Multiple Internal Variables.....	225
11.3.2	Incremental Response	225
11.3.3	Example	226
11.4	Continuous Models with Internal Functions	228
11.4.1	Energy Potential Functional	228
11.4.2	Force Potential Functional.....	229
11.4.3	Legendre Transformation of the Force Potential Functional	230
11.4.4	Incremental Response	230
11.4.5	Example	231
11.5	Visco-hyperplastic Model for Undrained Behaviour of Clay	233
11.5.1	Formulation.....	233
11.5.2	Incremental Response	234
11.5.3	Comparison with Experimental Results	235
11.5.4	Extension of the Model to Three Dimensions.....	238
11.6	Advantages of the Rate-dependent Formulation.....	239
12	Behaviour of Porous Continua	241
12.1	Introduction	241
12.2	Thermomechanical Framework	242
12.2.1	Density Definitions, Velocities, and Balance Laws.....	243
12.2.2	Tractions, Stresses, Work, and Energy	245
12.2.3	The First Law.....	246
12.2.4	Equations of Motion.....	248
12.2.5	The Second Law	248
12.2.6	Combining the First and Second Laws	249
12.2.7	The Internal Energy Function	251
12.2.8	The Dissipation Function and Force Potential	251
12.2.9	Constitutive Equations.....	252
12.2.10	Discussion	254
12.3	The Complete Formulation	255
12.3.1	Modifications to Account for Tortuosity	255
12.4	Legendre-Fenchel Transforms	256
12.5	Small Strain Formulation.....	257
12.6	Example	258
12.7	Conclusions	261
13	Convex Analysis and Hyperplasticity	263
13.1	Introduction	263
13.2	Hyperplasticity Re-expressed in Convex Analytical Terms	264
13.3	Examples from Elasticity.....	265
13.4	The Yield Surface Revisited	268
13.5	Examples from Plasticity.....	270

14	Further Topics in Hyperplasticity	273
14.1	Introduction	273
14.2	Damage Mechanics	274
14.3	Elementary Structural Analysis	277
14.3.1	Pin-jointed Structures	277
14.3.2	More General Structures	279
14.3.3	Assemblies of Rigid Elements	281
14.4	Bending of Prismatic Beams	284
14.5	Large Deformation Rubber Elasticity	286
14.6	Fibre-reinforced Material	288
14.7	Analysis of Axial and Lateral Pile Capacity	290
14.7.1	Rigid Pile under Vertical Loading	290
14.7.2	Flexible Pile under Vertical Loading	294
14.7.3	Rigid Pile under Lateral Loading	297
14.7.4	Flexible Pile under Lateral Loading	298
15	Concluding Remarks	301
15.1	Summary of the Complete Formalism	301
15.2	Legendre-Fenchel Transforms	303
15.3	Some Future Directions	303
15.4	Concluding Remarks	304
Appendix A	Functions, Functionals and their Derivatives	305
A.1	Functions and Functionals	305
A.2	Some Special Functions	306
A.3	Derivatives and Differentials	307
A.4	Selected Results	309
A.4.1	Frechet Derivatives of Integrals	309
A.4.2	Frechet Derivatives of Integrals Containing Differential Terms	310
Appendix B	Tensors	311
B.1	Tensor Definitions and Identities	311
B.2	Mixed Invariants	313
B.2.1	Differentials of Invariants of Tensors	313
Appendix C	Legendre Transformations	315
C.1	Introduction	315
C.2	Geometrical Representation in $(n + 1)$ -dimensional Space	315
C.3	Geometrical Representation in n -dimensional Space	317
C.4	Homogeneous Functions	318
C.5	Partial Legendre Transformations	319
C.6	The Singular Transformation	320

C.7	Legendre Transformations of Functionals.....	321
C.7.1	Integral Functional of a Single Function	321
C.7.2	Integral Functional of Multiple Functions	322
C.7.3	The Singular Transformation	323
Appendix D	Convex Analysis.....	325
D.1	Introduction	325
D.2	Some Terminology of Sets	325
D.3	Convex Sets and Functions	327
D.4	Subdifferentials and Subgradients	328
D.5	Functions Defined for Convex Sets.....	329
D.6	Legendre-Fenchel Transformation	331
D.7	The Support Function	332
D.8	Further Results in Convex Analysis	334
D.9	Summary of Results for Plasticity Theory	334
D.10	Some Special Functions.....	336
