Glossary	xxiii
1 Introduction	1
1.1 Some Examples	1
1.2 Difficulties in Controlling Dead-time Systems	3
1.3 Historical Perspective	4
1.4 Outline of Chapters	7
2 Dead-time Processes	9
2.1 Dead-time Systems: Some Case Studies	9
2.1.1 A Heated Tank with a Long Pipe	9
2.1.2 Variable Dead Time: Temperature Control at a Solar Plant	11
2.1.3 High-order Systems	12
2.1.4 Control Level in an Evaporator Section of a Sugar Factory	16
2.1.5 Traffic Systems	17
2.2 Dynamic Behaviour of Dead-time Systems	19
2.2.1 Representation of Dead Time in the Frequency Domain	19
2.2.2 Polynomial Approximations of Dead Time	21
2.2.3 Discrete Representation of Dead Time	25
2.2.4 State-space Representation of Dead-time Systems	28
2.3 Simple Models for Typical Dead-time Systems	31
2.3.1 Linear Models Close to an Operating Point	32
2.4 Analysis of Modelling Errors	39
2.4.1 Modelling Error Representation	39
2.4.2 Modelling Errors in Dead-time Processes	41
2.5 Dead-time Uncertainties and Delay Margin	45
2.6 Control Problems Associated with Dead Times	46
2.7 A Predictor-based Solution: The Smith Predictor	48
2.8 Summary	50

2.9	Further Reading	51
2.10	Exercises	52
3	Identification of Dead-time Processes	55
3.1	Introduction	55
3.2	Step Impulse Response-based Methods	56
3.2.1	Graphical Methods	57
3.2.2	Two-point and Three-point Methods	59
3.2.3	Area-based Methods	63
3.2.4	Model Validation	66
3.3	Least Squares and Related Methods	67
3.3.1	The Least Squares Algorithm	68
3.3.2	Choice of Input Sequence	70
3.3.3	Recursive Least Squares	71
3.3.4	Dead-time Identification	73
3.3.5	Effect of Random Disturbances	77
3.3.6	Practical Aspects	80
3.4	Varying Dead Times	81
3.5	Summary	82
3.6	Further Reading	83
3.7	Exercises	83
4	PID Control of Dead-time Processes	85
4.1	Introduction	85
4.2	Can PID Be Used to Control Simple Dead-time Processes? ...	86
4.3	PID for Dead-time Processes: The Prediction Approach	91
4.3.1	The Equivalent Controller of the SP	91
4.3.2	PID Approximation	92
4.3.3	Internal Model Control Interpretation	93
4.3.4	Pole Placement Design	93
4.3.5	Pole-zero Cancellation Analysis	95
4.4	Robust PID Tuning for Dead-time Processes	97
4.4.1	Tuning for the Dominant Dead-time Case	98
4.4.2	Tuning for Standard and Parallel PIDs	100
4.4.3	Two-degree-of-freedom PID	101
4.4.4	Integrative Processes	103
4.4.5	Lag-dominant Processes	107
4.4.6	Robustness Analysis	110
4.4.7	Simple Tuning Rules	114
4.4.8	Achievable Performance	115
4.5	Analysis of Other Methods	117
4.5.1	The Ziegler–Nichols Tuning Method	117
4.5.2	The Cohen–Coon Tuning Method	118
4.5.3	The S-IMC Tuning Method	119
4.6	Comparative Examples	120

4.7	Case Study: Temperature Control in a Ceramic Dryer	122
4.7.1	Process Description	122
4.7.2	Controller Design	123
4.8	Case Study: Mobile Robot Path Tracking	125
4.8.1	Synchro-Drive Steering Angle Model	126
4.8.2	Path Tracking with the PID Controller	127
4.9	Summary	128
4.10	Further Reading	129
4.11	Exercises	129
5	The Smith Predictor	131
5.1	The Smith Predictor Revisited	131
5.1.1	Closed-loop Properties of the SP	132
5.1.2	Examples	134
5.2	Advantages and Drawbacks of the Smith Predictor	137
5.2.1	Reference Tracking and Disturbance Rejection	137
5.2.2	Robustness	140
5.2.3	The Smith Predictor for General Unstable Plants	145
5.2.4	The Smith Predictor for Integrative Processes	146
5.3	The Two-degree-of-freedom SP	149
5.3.1	General Tuning	150
5.3.2	Tuning of the 2DOF-SP for the FOPDT Model	154
5.3.3	Predictive PI Controller	155
5.3.4	Robust Tuning	156
5.3.5	Case Study: Air Flow Control System	157
5.4	When to Use a DTC	158
5.5	Summary	161
5.6	Further Reading	162
5.7	Exercises	162
6	Dead-time Compensators for Stable Plants	165
6.1	A Simple Robust Solution: The Filtered SP	165
6.1.1	Case Study: Temperature Control at a Pilot Plant	169
6.2	The SP with a Modified Fast Model	172
6.3	Improving the Disturbance Rejection Capabilities	177
6.3.1	The DTC With a Feedforward Action	177
6.3.2	The Disturbance Observer DTC	181
6.4	IMC Interpretation of the DTC	185
6.5	Summary	188
6.6	Further Reading	188
6.7	Exercises	188

7	Dead-time Compensators for Unstable Plants	191
7.1	Introduction	191
7.2	DTC for Unstable Processes	192
7.3	Using a Modified Fast Model	193
7.3.1	The Modified Fast Model for the Integrative Case	194
7.3.2	The Modified Fast Model for the First-order Unstable Case	194
7.3.3	Implementation Issues	196
7.3.4	Simple Tuning for the IPDT Model	197
7.3.5	Robust Tuning for the IPDT Model	198
7.4	The Filtered Smith Predictor	203
7.4.1	Tuning for the Integrative Case	204
7.4.2	Tuning for the First-order Unstable Plant	206
7.5	Rejecting Disturbances with Feedforward Action	206
7.5.1	The Disturbance Observer Approach	207
7.5.2	Special Solutions for Integrative Processes	213
7.6	Achievable Robustness for Unstable Plants	221
7.7	Summary	225
7.8	Further Reading	226
7.9	Exercises	226
8	Discrete Dead-time Compensators	229
8.1	Introduction	229
8.2	Discrete and Sampled-data Systems	230
8.2.1	Basic Concepts and Notations	230
8.2.2	General Design Considerations	232
8.3	Direct Synthesis	233
8.3.1	Direct Synthesis for Dead-time Processes and IMC	234
8.3.2	Dead-beat Controller	235
8.3.3	The Dahlin Algorithm: The Lambda Controller	236
8.4	DTC for Discrete Processes	236
8.4.1	Closed-loop Analysis	236
8.4.2	A Particular Design Case: The Discrete DO-DTC	238
8.4.3	Case Study: Supply-chain Management	241
8.5	DTC for Sampled-data Processes	244
8.5.1	Discretisation of the Continuous DTC	244
8.5.2	Direct Discrete Design	251
8.5.3	Robustness Analysis	252
8.6	Sampling Time Choice	258
8.6.1	Sampling Time Choice and Robustness	259
8.6.2	A Procedure for Sampling Time Choice	259
8.7	Implementation Issues	262
8.8	Case Study: Temperature Control	265
8.9	Summary	266

8.10	Further Reading	268
8.11	Exercises	268
9	Model Predictive Control of Dead-time Processes	271
9.1	Introduction	271
9.2	MPC Overview	272
9.2.1	MPC Strategy	272
9.2.2	MPC Elements	274
9.3	GPC for Dead-time Processes: A DTC Approach	281
9.3.1	Model Considerations	281
9.3.2	The Case with $T = 1$	282
9.3.3	The Case with $T \neq 1$	292
9.3.4	GPC for SOPDT models	293
9.4	Classical Representation of DMC	297
9.4.1	Computing the Predictions	298
9.4.2	Minimisation of J	299
9.4.3	Prediction at $t + d$	299
9.5	MPC and Dead Times	303
9.6	Dead-time Problems in MPC Algorithms	304
9.7	Summary	306
9.8	Further Reading	307
9.9	Exercises	307
10	Robust Predictive Control of Dead-time Processes	309
10.1	Robustness Analysis of the Basic GPC	309
10.1.1	Analysis of F_r	311
10.1.2	Comparative Analysis Between GPC and SP	314
10.2	Improving Robustness	317
10.2.1	GPC with the T -polynomial	317
10.2.2	GPC with Q -parametrisation	319
10.2.3	Comparing GPC and DTC Robustness	322
10.2.4	Simulation Results	323
10.3	A DTC-based GPC	324
10.3.1	The Algorithm	325
10.3.2	Tuning	327
10.3.3	The Effect of Controller Parameters	329
10.4	Case Study: A Solar-powered Air Conditioning Plant	332
10.4.1	Plant Description	332
10.4.2	Control Strategy and Model Identification	333
10.4.3	SPGPC Tuning and Results	336
10.5	Summary	338
10.6	Further reading	339
10.7	Exercises	340

11	Multivariable Dead-time Compensation	343
11.1	Introduction	343
11.2	Basic Concepts and Notation	344
11.3	Closed-loop MIMO Relationships	345
11.4	Multivariable Dead-time Compensators	348
11.4.1	The Single Dead-time Case	348
11.4.2	Multiple Dead-time Case: The Simplest Solution	351
11.4.3	Multiple Dead-time Case: An Improved Fast Model	354
11.4.4	The General Multiple Dead-time Case	358
11.4.5	Summary of the Design Procedure	363
11.5	Analysis of GMDC Characteristics	364
11.6	Summary	370
11.7	Further Reading	371
11.8	Exercises	372
12	Robust MPC for MIMO Dead-time Processes	375
12.1	Introduction	375
12.2	The MIMO Discrete Model	376
12.3	DTC Interpretation of the MIMO-GPC	379
12.4	The MIMO-DTC-GPC	387
12.5	Robustness Analysis of MIMO Controllers	388
12.5.1	MIMO Uncertainty Representation	388
12.5.2	MIMO Robustness Analysis	392
12.5.3	MPC Robustness	393
12.5.4	Improving Robustness of the MIMO-DTC-GPC	395
12.6	Implementation Issues	398
12.7	Case Studies	398
12.7.1	Heavy Oil Fractionator Control	398
12.7.2	Mobile Robot Path Tracking	401
12.8	Summary	406
12.9	Further Reading	406
12.10	Exercises	407
13	Control of Nonlinear Dead-time Processes	409
13.1	Introduction	409
13.2	Constraints in Process Control	410
13.3	DTC for Constrained Processes	411
13.3.1	MPC and Constrained Dead-time Processes	413
13.4	Nonlinear Processes and Dead-time	417
13.4.1	Nonlinear Process Models	417
13.5	The DTC Algorithm and Nonlinear Processes	420
13.6	Nonlinear MPC and Dead-time Processes	421
13.7	Summary	425
13.8	Further Reading	426
13.9	Exercises	426

14 Prediction for Control	429
14.1 Introduction	429
14.2 Optimal Predictors: Closed-loop Analysis	430
14.3 Integrating Predictions and Control	433
14.3.1 A Classical Solution	433
14.3.2 A Quasi-optimal Solution	438
14.4 Summary	442
14.5 Further Reading	442
14.6 Exercises	442
A Appendix	445
A.1 Derivation of the Predictions in GPC	445
A.2 Deriving the GPC Equivalent Controller	446
A.3 Derivation of the Predictions in DMC	448
A.4 The MIMO-GPC Structure	450
References	451
Index	459
