

CONTENTS

1	BASIC VARIATIONAL PRINCIPLES OF STATIC AND GEOMETRY IN STRUCTURAL MECHANICS	1
1.1	Preliminaries	1
1.1.1	Formally conjugate differential operators	2
1.2	Basic integral identity	5
1.3	Various types of stress and strain fields	11
1.4	The general principle of statics and geometry	13
1.4.1	The principle of virtual displacements as an implication of the general principle of statics and geometry	18
1.4.2	The principle of virtual stress increments as an implication of the general principle of statics and geometry	20
1.4.3	Theorem of field orthogonality	22
1.4.4	Integral identity by Papkovitch	24
1.5	Final comments to Chapter 1	25
	References	27
2	BASIC VARIATIONAL PRINCIPLES OF STRUCTURAL MECHANICS	29
2.1	Energy space	29
2.1.1	Physically admissible fields	29
2.1.2	Betty theorem	30
2.1.3	Energy of strain. Clapeyron theorem	33
2.1.4	Rigid displacements	35
2.1.5	Strain compatibility conditions in the form of an integral identity	41
2.1.6	Necessary conditions for an equilibrium state of a system to exist	44
2.1.7	Theorem of a general form of an arbitrary physically admissible field	45
2.1.8	Lagrangian energy space	46
2.1.9	Prager-Synge identity	49
2.2	Lagrang variational principle	50
2.2.1	Conservative external forces	50
2.2.2	Lagrange functional	51
2.3	Castigliano variational principle	54
2.3.1	Castigliano functional	54
2.3.2	Castigliano energy space	56
2.4	Sensitivity of the strain energy to modifications of a system	59
2.4.1	First theorem of the strain energy minimum	59
2.4.2	Remarks on the effect of additional constraints (kinematical and force)	61

• Kinematical constraints	61
• Force constraints	63
2.4.3 Build-up of a system	68
2.4.4 Modification of stiffness properties of a system	70
2.4.5 Perturbation of external actions	72
2.4.6 Second theorem of the strain energy minimum	74
2.4.7 St.-Venant principle and its energy-based background	75
2.5 Generalized forces and generalized displacements	78
2.5.1 Force actions. Castigliano theorem	78
2.5.2 Kinematic actions. Lagrange theorem	81
2.5.3 Inversion of stiffness and compliance matrices	83
2.5.4 Lemma of constraints	84
2.5.5 Mohr formula and its reciprocal	86
2.6 Basic variational principles in problems with initial strains	89
2.7 Statically determinate and statically indeterminate systems ...	93
2.8 Final comments to Chapter 2	95
References	96
3 ADDITIONAL VARIATIONAL PRINCIPLES	
OF STRUCTURAL MECHANICS	99
3.1 Reissner mixed variational principle	99
3.1.1 Reissner functional	100
3.1.2 Principle of minimum for stresses	104
3.1.3 Principle of maximum for displacements	106
3.2 Principle of stationarity of the boundary conditions functional	107
3.3 A variational principle for physical relationships	109
3.4 Hu-Washizu mixed variational principle	110
3.5 A generalized mixed variational principle	112
3.5.1 A generalized solution of a problem	113
3.5.2 A generalized mixed functional	114
3.5.3 A connection between the Lagrange & Reissner functionals and the generalized mixed functional	116
3.5.4 Parametrized energy space	118
3.6 Gurtin's variational principle	120
3.6.1 Gurtin's functional	121
3.7 Geometric interpretation of functionals used in	
 structural mechanics	125
3.7.1 Generalized mixed functional	125
3.7.2 A remark on the Gurtin functional	130
3.8 Final comments to Chapter 3	131
References	132
4 PARTICULAR CLASSES OF PROBLEMS IN STRUCTURAL	
 MECHANICS – part 1	135
4.1 Variations of the operator formulations in structural	
 mechanics	135
4.1.1 Statement of a problem in displacements	135
4.1.2 Statement of a problem in stresses	136

4.2 Spatial elasticity	138
4.2.1 Lagrange functional	144
4.2.2 Reissner functional	145
4.2.3 Castigliano functional	146
4.2.4 Gurtin functional (third form)	146
4.3 Plane elasticity	146
4.3.1 Lagrange functional	149
4.3.2 Castigliano functional	150
4.3.3 Reissner functional	150
4.4 Lengthwise deformation of a straight bar	151
4.5 Bernoulli-type beam on elastic foundation	154
4.6 Timoshenko-type beam on elastic foundation	163
4.6.1 Another remark on kinematic boundary conditions for a Timoshenko beam	170
4.7 Planar curvilinear bar, shear ignored	171
4.7.1 Geometric equation	174
4.7.2 Equations of equilibrium	181
4.7.3 Stresses conjugate to the Vlasov vector of strains	187
4.7.4 Variational principles for curvilinear bars	193
• Lagrange functional	195
• Castigliano functional	197
• Reissner functional	198
4.7.5 Remark on comparison of solutions in various formulations of curvilinear-bar-related problems	199
4.8 Planar curvilinear bar, shear considered	204
4.8.1 Geometry of a curvilinear bar revisited	204
4.8.2 Allowing for shear deformations	207
• Bars of medium and big curvature	209
• Bars of small curvature	214
4.8.3 Estimation of changes in the strain energy introduced by switching to the refined theory	217
4.9 Final comments to Chapter 4	219
References	220
5 PARTICULAR CLASSES OF PROBLEMS IN STRUCTURAL MECHANICS – part 2	221
5.1 Thin plate bending – Kirchhoff-Love theory	221
5.1.1 Local basis in points of boundary Γ of area Ω	230
5.1.2 Matrix representation of basic relationship in the Kirchhoff-Love plate theory	233
5.1.3 Basic integral identity for thin plate bending	237
5.1.4 Boundary conditions for thin plate bending	241
5.1.5 Important functionals for thin plate bending	244
• Lagrange functional	244
• Castigliano functional	247
• Reissner functional	249
• Herrmann functional	250

5.2 Static-geometric analogy in the theory of plates	252
5.2.1 A stress function vector in the theory of plates	252
• Physical meaning of the stress function in plane stress	255
• Physical meaning of the stress function in plate bending ..	257
5.2.2 A static-geometric analogy in the theory of plates	261
5.2.3 Boundary conditions for deformations in the theory of plates	266
• Boundary conditions for deformations in plane stress	267
• Boundary conditions for deformations in plate bending	272
5.3 Nending of medium-thickness plates – Reissner’s theory	274
5.3.1 A governing system of equations for a Reissner plate with respect to two unknown functions	283
5.3.2 Basic integral identity in the Reissner plate theory	286
5.3.3 Important functionals for the reissner plate	287
• Lagrange functional	287
• Castigliano functional	288
• A stress function vector for the Reissner plate	290
• A Reissner functional for a Reissner plate	292
5.4 Some examples	293
5.4.1 Example 1. A round plate loaded by a torque on its edge	293
5.4.2 Example 2. A square plate loaded by a torques on its edge ...	297
5.4.3 Example 3. A simply supported rectangular plate	299
• Reissner plate	299
• Kirchhoff plate	303
5.5 Final comments to Chapter 5	306
References	310
6 PARTICULAR CLASSES OF PROBLEMS IN STRUCTURAL MECHANICS – part 3	313
6.1 Torsion of solid bars – Saint-Venant’s theory	313
6.1.1 Saint-Venant torsion function. Lagrange functional	316
6.1.2 Prandtl stress function. Timoshenko functional	319
• Bredt theorem of the tangential stress circulation	324
• Center of twist	326
6.1.3 Two-sided estimates of a section’s torsion inertia moment ...	327
6.1.4 A remark on Reissner-type functionals for the bar torsion analysis	331
6.1.5 A membrane analogy by Prandtl. Torsion of a narrow strip	333
6.2 Thin-walled open-profile bars – a theory by Vlasov	337
6.2.1 Basic assumptions in the theory of thin-walled open-profile bars	340
6.2.2 Equations of equilibrium of an open-profile thin-walled bar	351
6.2.3 Center of twist, center of bending	356
6.2.4 Tangential stresses in the open-profile thin-walled bar theory	358
6.2.5 A matrix form of basic relationship in the theory of open-profile thin-walled bars	361
6.2.6 Basic integral identity in the theory of open-profile thin-walled bars	363

6.2.7 Basic variational principles in the theory of open-profile thin-walled bars	364
6.2.8 A remark on non-warped cross-sections in the open-profile thin-walled bars	368
6.3 Allowing for shearing in open-profile thin-walled bars	371
6.3.1 Basic integral identity in the shear theory of open-profile thin-walled bars	379
6.3.2 Basic variational principles in the shear theory of open-profile thin-walled bars	380
6.3.3 A remark on the shear theory of open-profile thin-walled bars for non-warped cross-sections	381
6.3.4 Remark on a matrix of cross-section shape factor, μ	384
6.4 A semi-shear theory of open-profile thin-walled bars	386
References	392
7 PARTICULAR CLASSES OF PROBLEMS IN STRUCTURAL MECHANICS – part 4	395
7.1 Closed-profile thin-walled bars – a theory by Umanski	395
7.1.1 Pure torsion of a closed-profile thin-walled bar	396
7.1.2 A general behavior of a closed-profile thin-walled bar	402
• Tangential stresses	406
• Properties of functions $\bar{S}_{oz}$, $\bar{S}_{oy}$, $\bar{S}_{o\bar{\omega}}$	409
7.1.3 General physical relationships in the theory of closed-profile thin-walled bars	412
7.1.4 First (energy-based) version of the theory	415
• Physical relationships in the first (energy-based) version of the semi-shear theory	417
• Governing equations of the first version of the semi-shear theory	419
• A semi-shear theory by Janelidze-Panjvko	420
7.1.5 Second (physical) version of the theory	421
• A semi-shear theory by Umanski	427
7.1.6 A remark on non-warped cross-sections of closed-profile thin-walled bars	428
• Basic relationships of the theory of closed-profile thin-walled bars for non-warped cross-sections	430
7.2 Multiple-contour, closed-profile, thin-walled bars	432
7.2.1 Pure torsion of a multiple-contour profile	432
• A topologic structure of a multiple-contour profile	437
• A warped function for a multiple-contour profile	442
7.2.2 A general behavior of a multiple-contour profile	445
• Tangential stresses in a multiple-contour profile	445
• Governing equations for thin-walled bars having closed multiple-contour profile	455
References	456

8 PARTICULAR CLASSES OF PROBLEMS IN STRUCTURAL MECHANICS – part 5	459
8.1 Compound-profile thin-walled bars	459
8.1.1 Pure torsion of a compound-profile thin-walled bars	461
8.1.2 A general behavior of a compound-profile thin-walled bar	466
• Average tangential stresses	466
• Properties of functions $\bar{S}_{oz}$, $\bar{S}_{oy}$, $\bar{S}_{o\overline{m}}$ and consequences of these properties	469
• Physical relationships of the theory of compound-profile thin-walled bars	474
8.1.3 Non-warped compound profiles	475
8.2 Multiple-contour compound profile	476
8.2.1 Topology of a multiple-contour compound profile	477
8.2.2 Pure torsion of a multiple-contour compound profile	478
• A warp function for a multiple-contour compound profile	479
8.2.3 A general behavior of a thin-walled multiple-contour compound profile	482
8.3 Final comments to thin-walled bar theories	484
8.3.1 A remark on the energy-based comparison between Vlasov's shear-free theory and semi-shear theory of open-profile thin-walled bars	484
• An example	485
8.3.2 A remark on the Luzhin equations for compound-profile thin-walled bars	487
8.3.3 Classification criteria for separation between theories of thin-walled bars	491
8.3.4 Final remarks	493
References	494
9 THE RITZ METHOD AND ITS MODIFICATIONS	497
9.1 The basic theorem of the Ritz method	497
9.2 The Ritz method in application to mixed functionals	507
9.2.1 The Ritz method in application to the Reissner functional	507
9.2.2 The Ritz method in application to the generalized mixed functional Φ	511
• An example	513
9.3 Method of two functionals	516
9.3.1 Weak and strong solutions with respect to stresses	517
9.3.2 A remark on existence of a strong solution with respect to stresses	519
9.3.3 A remark on consistence approximations for minimization of functional D	521
9.3.4 A remark on the connection between functional D and the Reissner functional	523
• The method of two functionals and the method of conjugate approximations by Oden	524

9.3.5 Examples of application of the method of two functionals ...	526
• Example 1	526
• Example 2	529
• Example 3	533
References	537
10 VARIATIONAL PRINCIPLES IN SPECTRAL PROBLEMS	539
10.1 Basic concepts. Terminology	539
10.2 The spectral problem as a variational problem	542
10.2.1 The spectrum of a mechanical system with finite number of degrees of freedom	542
• Metric ideas in the spectral eigenvalue problem	547
10.2.2 Variational description of eigenvalues	551
• A remark on expansion of an arbitrary vector over a basis of eigenvectors	553
• A recursive variational definition of eigenvalues and eigenvectors	554
• A remark on the effect of constraints on first eigenvalue ...	555
• A variational technique to find the eigenvalues independently from one another	558
• A general Routh theorem about the effect of constraints on the eigenvalues of a mechanical system	560
• Kinematic constraints which do not alter the number of dynamic degrees of freedom in a mechanical system	561
10.2.3 A geometric description of eigenvalues and eigenvectors. A Rayleigh ellipsoid	565
• A notion of a maximum-rigidity constraints	567
10.3 A general spectral problem	569
10.3.1 An expansion of an arbitrary function over the eigenfunctions	572
10.4 The Ritz method in the spectral problem	573
10.4.1 The Ritz method in the spectral problem, applied to the Reissner functional	577
10.4.2 The method of two functionals in the spectral problem	582
• Example 1	584
• Example 2	587
10.4.3 A remark on an effect which arises when the finite element method in its mixed form is applied to the spectral problems	588
10.4.4 A generalized mixed functional in the spectral problem	597
10.5 Final comments to Chapter 10	601
References	602
11 VARIATIONAL PRINCIPLES IN STABILITY/BUCKLING ANALYSIS	605
11.1 Stability of systems with a finite number of degrees of freedom	606
11.1.1 A functional of stability – Bolotin’s functional	613

11.1.2 Linear analysis and a linearized formulation of the stability problem	614
11.1.3 Example 1	617
11.1.4 Example 2 – paradoxes in the stability analysis	625
• A remark on a non-invariant critical load to the choice of generalized coordinates	632
11.2 Variational description of critical loads	634
11.2.1 A Rayleigh ratio and a recursive variational calculation of critical loads	635
11.2.2 A remark on the effect of constraints on the stability of a linearized elastic system	639
11.2.3 Papkovitch theorem of convexity of the stability area.....	642
11.2.4 The geometric stiffness matrix revisited	649
11.2.5 The stability of equilibrium under a non-force-type action	651
11.3 Geometrically nonlinear problems in elasticity	655
11.3.1 Geometric equations	655
• Expressions of variations of the strain tensor components ..	657
11.3.2 Equations of equilibrium and static boundary conditions ...	658
11.4 Stability of equilibrium of an elastic body	663
11.4.1 A linearized formulation of the equilibrium stability problem for an elastic body	665
• A remark on a mechanical interpretation of particular terms in the stability functional	668
• Criteria of a critical state in a system	669
11.4.2 The Ritz method	673
11.5 Stability of equilibrium in particular classes of problems	675
11.5.1 Stability of equilibrium of a bar in the engineering theory of bars	676
11.5.2 Stability of equilibrium of a Timoshenko bar	679
11.5.3 Stability of equilibrium of a Kirchhoff-Love plate	686
11.5.4 Stability of equilibrium of a Reissner plate	687
11.5.5 Stability of equilibrium of a thin-walled bar	690
11.6 Mixed functionals in the stability analysis	694
11.7 Final comments to Chapter 11	696
References	697
 CONCLUSION	 701
APPENDIX	703
A. The Legendre and Friedrichs transforms	703
A.1 The Legendre transform in the finite-dimensional case	703
A.2 The Legendre transform in the general case	709
A.3 The Friedrichs transform	711
• The Friedrichs transform in the finite-dimensional case	712
• The Friedrichs transform in the general case	713
References	714

B. Tangential stresses in the bending of bars	715
B.1 Tangential stresses in the bending of straight bars	715
B.2 Tangential stresses in the bending of curvilinear bars	723
