Preface		vii
Chapter 1	Models: Language, Graphic, Analogue, Scale, Mathematical & Computer Models A review of modelling types, in particular the key manual processes involved in graphics.	1
Chapter 2	Computer Languages: & Java Programming An introduction to the computer-programming environment, particularly the structured programming constructs that will act as the language framework for defining graphic algorithms and commands.	33
Chapter 3	Programming Development Environment for Graphics An introduction to the basic drawing commands that will be used to build illustrative programs, starting with simple imperative commands.	71
Chapter 4	Conditional Action - Spatial Searching & Problem Solving An extension of examples from chapter 3 to introduce conditional and repeat commands for solving spatial searching tasks.	103
Chapter 5	Display System and Hardware Programming Primitives Display system hardware, the primitive display functions from which useful graphic systems have to be constructed.	135
Chapter 6	Computer Hardware and Low Level Machine Language Programming Introducing the hardware of the computer system using a simplified system simulation to present the lowest level of language programming.	177

Chapter 7	Intermediate, Assembler Language Programming Macro Expansions, and Expression Translation	223
	Demonstrating the development of an intermediate, assembly language to give a more flexible programming system.	
Chapter 8	Higher Level Languages – Translation, Interpretation and Scripting	273
	Introducing a simple high level language translation system with extensions to the hardware simulation system to support recursive procedure calling, context switching and interactive graphics work.	
Chapter 9	Primitive, Raster-Infill Operations: Line Interpolation	321
	Returning to the graphics primitives introducing line interpolation on a raster grid and a series of direct imperative operations.	
Chapter 10	Area Fill, Masks, Circles and Thick Line Interpolation	359
	Extending the infill procedures to include area shading and area masking operations.	
Chapter 11	Parametric Line Interpolation & Keyframe Infill “Inbetweening” Film Animation	403
	Introducing inbetweening for key frame animation using parametric lines and curves. Extending these to include area shading for curved boundary regions.	
Chapter 12	Geometry, Algebras, Co-ordinate Systems, and Transformations	457
	Introducing geometric transformations to give rigid body animation movements, and other transformations useful for editing and constructing drawings and images.	
Chapter 13	Spatial Relationships Overlap & Adjacency: Point to Line to Area	499
	Returning to conditional spatial commands. Exploring the relational tests of adjacency and overlap for points, lines and polylines.	
Chapter 14	Spatial Relationships Overlap & Adjacency Polygon on Polygon	533
	Area on area relational tests for polygons. Boundary intersection for overlaid polygons. Edge and area labelling in networks. Boolean operations on areas.	

Chapter 15	Spatial Relationships Overlap & Adjacency Rectangle-Rectangle Window on Window	571
	Area on area relational tests for rectangles. Interactive window based systems. Exploiting block memory transfers and base displacement addressing in fast display system operations.	
Chapter 16	GUI: Graphic User Interfaces: Control Design Animation & Simulation Systems	615
	Bringing all these studies together to give a two-dimensional drawing system. This also provides the graphic framework for simulation systems based on diagrams.
