Foreword	VII
1 Introduction	1
1.1 Synopsis	1
1.2 Background	3
1.2.1 Senescence – Paradox? – Inevitable?	3
1.2.2 Evolutionary Theories of Senescence	4
1.2.3 Measuring Senescence	5
1.2.4 Measuring Fitness	9
1.2.5 Optimal Life History	10
1.2.6 Interesting Recent Developments	13
1.3 Orientation	15

Part I Hamilton

2 Hamilton’s Indicators of the Force of Selection	19
2.1 Introduction	19
2.2 Hamilton’s Derivations	20
2.2.1 The Framework	20
2.2.2 Hamilton’s Indicator of Survival	21
2.3 Alternative Indicators	22
2.3.1 Different Parametrization	22
2.3.2 When Selection Pressure Increases	22
2.3.3 Fertility Indicators	23
2.3.4 Are Some Indicators Better?	24
2.3.5 Optimization vs. Mutational Burden	26
2.4 Mutation–Selection Balance	26
2.4.1 Additive vs. Proportional Parametrization	27

2.4.2	A Simple Box Model	28
2.5	The Importance of Mutation Accumulation	32
2.6	Conclusion	33
3	Further Challenges	35
3.1	General Problem with All Indicators	35
3.2	Theoretical Arguments	38
3.2.1	Mutation–Selection Balance	38
3.2.2	Unraveling	38
3.2.3	Variable Environments	40
3.2.4	Other Mechanisms	41
3.3	Empirical Evidence	41
3.3.1	Testing Preconditions for Mutation Accumulation	41
3.3.2	Checking Predictions from Mutation Accumulation	42
3.3.3	Empirical Evidence for Non-senescence	44
3.4	Conclusion	45

Part II Optimization Models

4	Optimization Models Based on Size	49
4.1	Size Matters	49
4.2	A Size-Based Life-History Model	51
4.2.1	The General Optimization Problem	53
4.2.2	The Specific Optimization Problem	54
4.3	An Optimization Model that Leads to Non-senescence ..	57
4.3.1	The State Ratchet	58
4.3.2	The Maximum Principle	59
4.3.3	An Alternative Derivation	63
4.3.4	The Simplest Model Leads to Sustenance	65
4.3.5	Introducing Nonlinearity Can Lead to Enhancement ..	67
4.4	An Optimization Model that Leads to Senescence	68
4.5	Discussion	71
4.6	Next Steps	73
5	An Optimization Model Based on Vitality	75
5.1	The Vitality Model	76
5.1.1	The Parameters	81
5.2	The Vitality Model as a Control Problem	83
5.2.1	Problem Formulation	83
5.2.2	Solution	85

5.2.3	The Role of the Second State Variable.....	87
5.2.4	Hamilton and Reproductive Value - Revisited	88
5.3	The Constrained Vitality Model.....	90
5.3.1	Expected Solutions	94
5.4	Numerical Results	98
5.4.1	The Five Varieties of Life History Strategies	98
5.4.2	When Senescence Is Optimal and when It Is Not .	108
5.5	Discussion.....	116
5.5.1	Senescence vs. Non-senescence	116
5.5.2	The η Parameters in Nature	117
5.5.3	The Mortality Paradox	119
5.5.4	Plateaus	121
5.6	Summary	121
6	Directions for Research	123
6.1	Orientation.....	123
6.2	Direct Extensions of my Models.....	123
6.2.1	Linking Burden & Optimization	123
6.2.2	Measurable Quantities and Testable Hypotheses ..	124
6.2.3	The Diversity of Aging	125
6.2.4	The Characteristics of Senescent vs. Non-senescent Species	125
6.2.5	Alternative Applications.....	127
6.3	Other Modeling Extensions.....	127
6.3.1	Density Effects	127
6.3.2	Intergenerational Transfers.....	128
6.3.3	Environmental Fluctuations.....	129
6.3.4	Population Dynamics	130
6.3.5	Summary	130
6.4	Prospects for Evolutionary Demography	131
6.4.1	Moving Beyond the Burden of “Deleterious Fixations”	131
6.4.2	The Need for Data, Methods, and Measures.....	133
6.4.3	A New Burning Question	135
6.5	Conclusion	138
A	Vitality Model - Appendix	141
A.1	Solving Differential Equations	141
A.2	Proof of Non-Existence of an Optimal Solution for a Special Case	143
A.3	The Algorithm.....	144
