Preface	v
1 Natural computing paradigms and emergent computation	1
1.1 Principles of natural computing	1
1.1.1 Natural computing structures as hierarchies of interconnected cells ..	1
1.1.2 The principle of optimal number of entities (Ockham's razor)	2
1.1.3 Natural computing systems are dissipative systems	3
1.1.4 Transient nature of the behavioral complexity of natural systems ..	3
1.1.5 Natural systems and recurrence	3
1.1.6 Emergence, complexity, and local activity of cells	3
1.2 Open problems and book description	4
2 Cellular nonlinear networks: state of the art and applications	7
2.1 Introduction	7
2.2 Typical applications of cellular computers	9
2.3 Hardware platforms for implementing cellular computers	12
3 Cellular and natural computing models and software simulation	15
3.1 Cellular systems: cells, neighborhoods, states and dynamics	15
3.1.1 Genes	17
3.1.2 Discrete and continuous states and outputs	17
3.1.3 Boundary conditions	17
3.2 Major cellular systems paradigms	18
3.2.1 The Cellular Neural Network (CNN) model	18
3.2.2 The Generalized Cellular Automata	19
3.2.3 Reaction-Diffusion Cellular Nonlinear Networks	20
3.3 Matlab simulation of Generalized cellular automata and cellular neural networks	21
3.3.1 Uncoupled GCAs	21
3.3.2 Coupled GCAs	23
3.3.3 Simulation of standard cellular neural networks	25
3.4 Nonlinear representation of cells	25
3.4.1 Piecewise-linear representation and implementation	26
3.4.2 Extended families of cells	36
3.4.3 Structured universes of cells	37
3.5 Modeling and simulation of semitotalistic cellular automata	38
3.6 Modeling and simulation of "Small-Worlds" systems	40
3.7 A wider variety of cells, taxonomy and family labels	41
3.8 A CA simulator for all kind of cells	43

4	Emergence, locating and measuring it	47
4.1	Emergence: the software engineering of cellular computing systems	47
4.2	Visual interpretation of emergent phenomena – classes of behaviors	48
4.3	Semitotalistic cells: a first step in narrowing the search space	57
4.4	Clustering and transients and as measures of emergence	60
4.4.1	Visualizing complexity for an entire family of cellular systems – Wolfram classes revisited	66
4.5	Simulation examples, properties, more accurate complexity measures ...	69
4.5.1	Properties of complexity measures	71
4.5.2	A composite complexity measure	74
5	Exponents of growth	77
5.1	Exponents of growth and their relationship to various emergent behaviors	77
5.2	Mutations for continuous state cellular systems	85
5.3	Distribution of exponents of growth among families of genes	87
5.4	Influences of the “Small World” model	89
5.4.1	The “small worlds” model allows fine tuning of the “edge of chaos”	90
5.5	On the independence between various measures of complexities	92
6	Sieves for selection of genes according to desired behaviors	95
6.1	Introduction	95
6.2	Defining sieves	96
6.3	Examples and applications of the double sieve method	99
6.3.1	Intelligent life behaviors and uncertainty in using sieves	99
6.3.2	Classic “Life”: using sieves to locate similar behaviors	101
6.3.3	Other interesting emergent behaviors	104
6.3.4	Sieves to locate feature extractors	107
6.3.5	Pink-noise generators	109
6.3.6	Sieving and intelligence – evolving a list of interesting genes	110
7	Predicting emergence from cell’s structure	113
7.1	Introduction	113
7.2	Relationships between CA behavior and the Boolean description of the cell	114
7.3	Parametrizations as tools to locate similar behaviors	116
7.4	The theory of probabilistic exponents of growth	118
7.4.1	Uncertainty index of a cell, active and expansion areas	120
7.4.2	Minimal set of cells to compute the probabilistic exponent of growth	121
7.4.3	Computing the cells function of probability	123
7.4.4	Computing the probabilistic exponent of growth	124
7.5	Exponents of growth and their significance	126
7.5.1	Predicting behaviors from ID, an example	127
7.5.2	Other properties of the probabilistic exponents of growth	127
7.5.3	Comparison with the experimental exponent of growth	129
7.6	Conclusions	130

8 Applications of emergent phenomena	133
8.1 Introduction	133
8.2 Smart sensor for character recognition	134
8.2.1 Motivation and general description	134
8.2.2 Architecture and functionality of the CA-based sensor	136
8.2.3 Feature extraction and classification	138
8.2.4 Experimental results	140
8.3 Excitable membranes, for temporal sequence classification	141
8.3.1 Mapping variable-length signals into terminal states	142
8.3.2 Detecting genes to build EMTMs	144
8.3.3 Experimental results in sound classification	145
8.4 Image compression using CA-based vector quantization	147
8.4.1 Coding and decoding principle	147
8.4.2 Detecting the useful genes	151
8.4.3 Results and comparison with other compression standards	153
8.4.4 Aspects on hardware implementation	156
References	159
Index	165

Systematic Design for Emergence in Cellular Nonlinear
Networks

With Applications in Natural Computing and Signal
Processing-

Dogaru, R.

2008, XII, 166 p. 80 illus., Hardcover
