List of Symbols	XXI
------------------------------	-----

Part I Mathematical Framework

1 On the Perron Root of Irreducible Matrices	3
1.1 Some Basic Definitions	3
1.2 Some Bounds on the Perron Root and their Applications	4
1.2.1 Concavity of the Perron Root on Some Subsets of Irreducible Matrices	11
1.2.2 Kullback–Leibler Divergence Characterization	14
1.2.3 A Rate Function Representation for Large Deviations of Finite Dimensional Markov Chains	15
1.2.4 Some Extended Perron Root Characterizations	20
1.2.5 Collatz–Wielandt-Type Characterization of the Perron Root	22
1.3 Convexity of the Perron Root	25
1.3.1 Some Definitions	26
1.3.2 Sufficient Conditions	28
1.3.3 Convexity of the Feasibility Set	30
1.3.4 Necessary Conditions	32
1.4 Special Classes of Matrices	34
1.4.1 Symmetric Matrices	35
1.4.2 Symmetric Positive Semidefinite Matrices	36
1.5 The Perron Root under the Linear Mapping	37
1.5.1 Some Bounds	39
1.5.2 Disproof of the Conjecture	42
1.6 The Perron Root under Exponential Mapping	45
1.6.1 A Necessary and Sufficient Condition on Strict Convexity of the Feasibility Set	45
1.6.2 Graph-theoretic Interpretation	48

1.7	Generalizations to Arbitrary Nonnegative Matrices	51
1.7.1	Log-Convexity of the Spectral Radius	52
1.7.2	Characterization of the Spectral Radius	52
1.7.3	Existence of Positive Eigenvectors	56
1.7.4	Collatz–Wielandt-Type Characterization of the Spectral Radius	57
1.8	Bibliographical Notes	59
2	On the Positive Solution to a Linear System with Nonnegative Coefficients	61
2.1	Basic Concepts and Definitions	61
2.2	Feasibility Sets	63
2.3	Convexity Results	66
2.3.1	Log-Convexity of the Positive Solution	67
2.3.2	Convexity of the Feasibility Set	69
2.3.3	Strict Log-Convexity	70
2.3.4	Strict Convexity of the Feasibility Sets	75
2.4	The Linear Case	76

Part II Principles of Resource Allocation in Wireless Networks

3	Introduction	81
4	Network Model	85
4.1	Basic Definitions	85
4.2	Medium Access Control	87
4.3	Wireless Communication Channel	90
4.3.1	Signal-to-Interference Ratio	94
4.3.2	Different Receiver Structures	98
4.3.3	Power Constraints	104
4.3.4	Data Rate Model	107
4.3.5	Examples	111
5	Resource Allocation Problem in Communications Networks	119
5.1	End-to-End Rate Control in Wired Networks	119
5.1.1	Fairness Criteria	120
5.1.2	Algorithms	124
5.2	Problem Formulation for Wireless Networks	125
5.2.1	Joint Power Control and Link Scheduling	126
5.2.2	Feasible Rate Region	129
5.2.3	End-to-End Window-Based Rate Control	132
5.2.4	MAC Layer Fair Rate Control	134
5.2.5	Utility-Based Power Control	136
5.2.6	Efficiency-Fairness Trade-Off	141
5.2.7	Kuhn–Tucker Conditions	146
5.3	Interpretation in the QoS Domain	150

5.4	Remarks on Joint Power Control and Link Scheduling	160
5.4.1	Optimal Joint Power Control and Link Scheduling	160
5.4.2	High SIR Regime	163
5.4.3	Low SIR Regime	163
5.4.4	Wireless Links with Self-Interference	167
5.5	QoS-based Power Control	168
5.5.1	Some Definitions	169
5.5.2	Axiomatic Interference Functions	174
5.5.3	QoS-Based Power Control Algorithms	180
5.6	Max-Min SIR Balancing Power Control	191
5.6.1	Some Preliminary Observations	192
5.6.2	Characterization under Sum Power Constraints	195
5.6.3	General Power Constraints	199
5.6.4	Some Consequences and Applications	204
5.7	Utility-based Power Control with QoS Support	210
5.7.1	Hard QoS Support	212
5.7.2	Soft QoS Support	213
5.8	Utility-Based Joint Power and Receiver Control	222
5.8.1	Problem Statement	222
5.8.2	Perfect Synchronization	224
5.8.3	Decentralized Alternating Computation	226
5.8.4	Max-Min SIR Balancing	227
5.9	Additional Results for a Noiseless Case	228
5.9.1	The Efficiency–Fairness Trade-off	229
5.9.2	Existence and Uniqueness of Log-SIR Fair Power Allocation	241
5.10	Proofs	246

Part III Algorithms

6	Power Control Algorithms	261
6.1	Introduction	261
6.2	Some Basic Definitions	262
6.3	Convex Statement of the Problem	264
6.4	Strong Convexity Conditions	266
6.5	Gradient Projection Algorithm	270
6.5.1	Global Convergence	270
6.5.2	Rate of Convergence	273
6.5.3	Diagonal Scaling	275
6.5.4	Projection on a Closed Convex Set	275
6.6	Distributed Implementation	276
6.6.1	Local and Global Parts of the Gradient Vector	276
6.6.2	Adjoint Network	278
6.6.3	Distributed Handshake Protocol	282
6.6.4	Some Comparative Remarks	283

6.6.5	Noisy Measurements	285
6.7	Incorporation of QoS Requirements	288
6.7.1	Hard QoS Support	289
6.7.2	Soft QoS Support	300
6.8	Primal-Dual Algorithms	302
6.8.1	Improving Efficiency by Primal-Dual Methods	304
6.8.2	Generalized Lagrangian	311
6.8.3	Primal-Dual Algorithms	319
6.8.4	Decentralized Implementation	322
6.8.5	Min-max Optimization Framework	326
6.8.6	Simulation Results	342

Part IV Appendices

A	Some Concepts and Results from Matrix Analysis	347
A.1	Vectors and Vector Norms	347
A.2	Matrices and Matrix Norms	349
A.3	Square Matrices and Eigenvalues	351
A.3.1	Matrix Spectrum, Spectral Radius and Neumann Series	353
A.3.2	Orthogonal, Symmetric and Positive Semidefinite Matrices	355
A.4	Perron–Frobenius Theory	357
A.4.1	Perron–Frobenius Theorem for Irreducible Matrices	358
A.4.2	Perron–Frobenius Theorem for Primitive Matrices	362
A.4.3	Some Extensions to Reducible Matrices	363
A.4.4	The Existence of a Positive Solution \mathbf{p} to $(\alpha \mathbf{I} - \mathbf{X})\mathbf{p} = \mathbf{b}$	371
B	Some Concepts and Results from Convex Analysis	377
B.1	Sets and Functions	377
B.2	Convex Sets and Functions	383
B.2.1	Strong Convexity	384
B.2.2	Majorization and Schur-Convexity	386
B.3	Log-Convex Functions	386
B.3.1	Inverse Functions of Monotonic Log-Convex Functions .	388
B.4	Basics of Optimization Theory	389
B.4.1	Characterization of Numerical Convergence	390
B.4.2	Convergence of Gradient Projection Algorithms	392
B.4.3	Basics of Lagrangian Optimization Theory	395
B.4.4	Saddle Points, Saddle Functions, Min-Max Functions ..	398
