

Contents

1	Introduction	1
2	Origin of Macroscopic Approach	7
2.1	Lossless Nonlinear Dielectric	7
2.2	Nondispersive Lossless Linear Dielectric	11
2.2.1	Quantization in Terms of a Dual Potential	11
2.2.2	Momentum Operator as Translation Operator	13
2.2.3	Wave Functional Description of Gaussian States	20
2.2.4	Source-Field Operator	23
2.2.5	Continuum Frequency-Space Description	31
2.3	Quantum Description of Experiments with Stationary Fields	36
2.3.1	Spatio-temporal Descriptions of Parametric Down-Conversion Experiments	38
2.3.2	From Coupled Quantum Harmonic Oscillators Back to Interacting Fields	64
3	Macroscopic Theories and Their Applications	85
3.1	Momentum-Operator Approach	85
3.1.1	Temporal Modes and Their Application	86
3.1.2	Slowly Varying Amplitude Momentum Operator	88
3.1.3	Space-Time Displacement Operators	102
3.1.4	Generator of Spatial Progression	104
3.1.5	Nonlinear Optical Couplers	110
3.2	Dispersive Nonlinear Dielectric	117
3.2.1	Lagrangian of Narrow-Band Fields	117
3.2.2	Propagation in One Dimension and Applications	126
3.3	Modes of Universe and Paraxial Quantum Propagation	133
3.3.1	Quasimode Description of Spectrum of Squeezing	133
3.3.2	Steady-State Propagation	137
3.3.3	Approximation of Slowly Varying Envelope	143
3.3.4	Optical Imaging with Nonclassical Light	152

3.4	Optical Nonlinearity and Renormalization	173
3.5	Quasimode Theory	186
3.5.1	Relation to Quantum Scattering Theory	193
3.5.2	Mode Functions for Fabry–Perot Cavity	200
3.5.3	Atom–Field Interaction Within Cavity	207
3.5.4	Several Sets of Quasimodes	213
4	Microscopic Theories	223
4.1	Method of Continua of Harmonic Oscillators	223
4.1.1	Dispersive Lossy Homogeneous Linear Dielectric	224
4.1.2	Correlation of Ground-State Fluctuations	235
4.2	Green-Function Approach	238
4.2.1	Dispersive Lossy Linear Inhomogeneous Dielectric	239
4.2.2	Dispersive Lossy Nonlinear Inhomogeneous Dielectric	242
4.2.3	Elaboration of Linear Theory	245
4.2.4	Optical Field at Dielectric Devices	253
4.2.5	Modification of Spontaneous Emission by Dielectric Media	258
4.2.6	Left-Handed Materials	263
4.2.7	Application to Casimir Effect	280
5	Microscopic Models as Related to Macroscopic Descriptions	303
5.1	Quantum Optics in Oscillator Media	303
5.2	Problem of Macroscopic Averages	305
5.2.1	Conservative Oscillator Medium	305
5.2.2	Kramers–Kronig Dielectric	311
5.2.3	Dissipative Oscillator Medium	312
5.3	Single-Photon Models	317
6	Periodic and Disordered Media	321
6.1	Quantization in Periodic Media	321
6.1.1	Classical Description of Electromagnetic Field	322
6.1.2	Modal Functions	323
6.1.3	Method of Coupled Modes	331
6.1.4	Normalized Modes of the Electromagnetic Field	334
6.1.5	Quantization in Linear Nonhomogeneous Nonconducting Medium	342
6.2	Corrugated Waveguides	349
6.2.1	Lossless Propagation in a Waveguide Structure	351
6.2.2	Coupled-Mode Theory Including Gain or Losses	359
6.3	Photonic Crystals	378
6.4	Quantization in Disordered Media	393
6.4.1	Quantization in Chaotic Cavity	394
6.4.2	Open Systems Approach	398

6.4.3	Semiclassical Approach	404
6.5	Propagation in Amplifying Random Media	408
6.5.1	Strongly Scattering Media	408
6.5.2	Incoherent and Coherent Random Lasers	414
6.5.3	Modal Decomposition in Optical Resonators	444
6.5.4	Chaotic Resonators	445
7	Conclusions	453
	References	457
	Index	475

Quantum Aspects of Light Propagation

Lukš, A.; Perinová, V.

2009, XI, 477 p., Hardcover

ISBN: 978-0-387-85589-9
