Preface	1
Victor Isakov	
Geometrization of Rings as a Method for Solving Inverse Problems	5
Mikhail Belishev	
1 Introduction	5
2 Algebra Handbook	7
3 Elliptic Inverse Problem	9
4 Hyperbolic Inverse Problem	14
References	23
The Ginzburg-Landau Equations for Superconductivity with Random Fluctuations	25
Andrei Fursikov, Max Gunzburger, and Janet Peterson	
1 Introduction	25
2 The Ginzburg–Landau Equation and Its Finite Difference Approximation	31
2.1 Boundary value problem for the Ginzburg–Landau equation	31
2.2 Approximation by the method of lines	32
3 The stochastic Ginzburg–Landau Equation	38
3.1 Wiener process	38
3.2 The stochastic problem for the Ginzburg–Landau equation	41
4 Discrete Approximation of the Stochastic Problem	43
4.1 Definition of a projector P_h in $L^2(G)$	43
4.2 Approximation of Wiener processes	45
4.3 The Ito integral	48
4.4 The discrete stochastic system	49
4.5 The Ito formula	50

5	A Priori Estimates	52
5.1	Application of the Ito formula	53
5.2	A priori estimate for $p = 1$	55
5.3	A priori estimate for $p = 2$	56
5.4	Auxiliary Wiener process	59
5.5	A priori estimates for $\Delta_h \psi_k$	65
6	Existence Theorem for Approximations	69
6.1	Preliminaries	69
6.2	Bounded approximations	70
6.3	Solvability of the discrete stochastic system	72
7	Smoothness of the Strong Solution with respect to t	75
7.1	Estimate of the mean maximum	75
7.2	Estimate of the auxiliary random process	76
7.3	Estimate of the mean modulus of continuity	80
8	Compactness Theorems	81
8.1	On compact sets in $L^2(G)$	81
8.2	Compact sets in the space of time-dependent functions	83
9	Weak Solution of the Discrete Stochastic Problem	85
9.1	Definition of the weak solution for the discrete problem	85
9.2	The equation for the weak solution of the discrete problem	87
10	Passage to the Limit in a Family of ν_{h_n}	88
10.1	Compactness of the family of measures ν_{h_n}	88
10.2	Passage to the limit	90
11	Estimates for the Weak Solution	90
11.1	An estimate for ν_h	91
11.2	Preliminary lemmas	92
11.3	Estimates for the measure ν	95
12	The Equation for the Weak Solution of the Stochastic Ginzburg–Landau Problem	97
12.1	Definition of the weak solution	97
12.2	The first steps of the proof for ν to satisfy (12.6) ..	98
12.3	Investigation of $f_{2,h}(\psi)$	102
12.4	Subspaces of piecewise linear functions	103
12.5	The measures $\hat{\nu}_{h_n}$ and their weak compactness	104
12.6	The final steps for passage to the limit	106
12.7	Proof of the equality (12.7)	109
13	Certain Properties of the Weak Statistical Solution ν	110
13.1	Boundary conditions	110
13.2	Solvability for almost all data	112
14	Uniqueness of the Weak Statistical Solution	113
14.1	Reduction of uniqueness for statistical solution ν to uniqueness of the solution for (12.1)	113

14.2	Proof of the uniqueness of the solution of (12.1) and (2.2): the first step	114
14.3	Estimation of the terms T_2 to T_5 , T_7 , and T_9	116
14.4	Estimation of T_6 and T_8	119
14.5	Uniqueness theorems	122
15	The Strong Statistical Solution of the Stochastic Ginzburg–Landau Equation	124
15.1	Existence and uniqueness of a strong statistical solution	124
15.2	On one family of scalar Wiener processes	125
15.3	Equation for a strong statistical solution	127
	References	131
Carleman Estimates with Second Large Parameter for Second Order Operators		135
Victor Isakov and Nanhee Kim		
1	Introduction	135
2	Pseudoconvexity Condition	139
3	Proof of Carleman Estimates for Scalar Operators	142
4	Proof of Carleman Estimates for Elasticity System	151
5	Hölder Type Stability in the Cauchy Problem	153
6	Lipschitz Stability in the Cauchy Problem	155
7	Conclusion	157
	References	158
Sharp Spectral Asymptotics for Dirac Energy		161
Victor Ivrii		
1	Introduction	161
2	Estimates	164
2.1	Special case	164
2.2	Smooth case	166
2.3	Singular homogeneous case	166
3	Calculations	168
3.1	Constant coefficients case	169
3.2	General microhyperbolic case	170
3.3	Scalar case	171
3.4	Schrödinger operator	175
3.5	Scalar case. II	177
3.6	General microhyperbolic case. II	183
	References	184
Linear Hyperbolic and Petrowski Type PDEs with Continuous Boundary Control $\rightarrow$ Boundary Observation		

Open Loop Map: Implication on Nonlinear Boundary Stabilization with Optimal Decay Rates		187
Irena Lasiecka and Roberto Triggiani		
1	Open-Loop and Closed-Loop Abstract Setting for Hyperbolic/Petrowski Type PDEs with Boundary Control . .	187
1.1	A key open-loop boundary control–boundary observation map: orientation	188
1.2	An historical overview on regularity, exact controllability, and uniform stabilization of hyperbolic and Petrowski type PDEs under boundary control	190
1.3	Abstract setting encompassing the second order and first order (in time) hyperbolic and Petrowski type PDEs of the present paper	196
2	Open Loop Problem (1.2.1): From B^*L Bounded to L Bounded, Equivalently $B^*e^{A^*} \cdot$ Bounded	203
3	Closed-Loop Nonlinear Feedback System: Uniform Stabilization with Optimal Decay Rates	208
4	A Second Order in Time Hyperbolic Illustration: The Wave Equation with Dirichlet Boundary Control and Suitably Lifted Velocity Boundary Observation	213
4.1	From the Dirichlet boundary control g for the wave solution $\{v, v_t\}$ to the boundary observation $\frac{\partial z}{\partial \nu} _T$, via the Poisson equation lifting $z = \mathcal{A}^{-1}v_t$. .	213
4.2	Proof of Theorem 4.1.4	221
4.3	The half-space problem: A direct computation	225
4.4	Implication on the uniform feedback stabilization of the boundary nonlinear dissipative feedback system w in (4.1.1a–c)	229
4.5	Implication on exact controllability of the (linear) dissipative system under boundary control	231
5	Corollary of Section 4: The Multidimensional Kirchhoff Equation with ‘Moments’ Boundary Control and Normal Derivatives of the Velocity as Boundary Observation	232
5.1	Preliminaries. The operator B^*L	232
5.2	Implication on the uniform feedback stabilization of the boundary nonlinear dissipative feedback system w in (5.1.1a–c)	236
5.3	Implication on exact controllability of the (linear) dissipative system under boundary control	238
6	A First Order in Time PDE Illustration: The Schrödinger Equation under Dirichlet Boundary Control and Suitably Lifted Solution as Boundary Observation	239

6.1	From the Dirichlet boundary control u for the Schrödinger equation solution y to the boundary observation $\frac{\partial z}{\partial \nu} _R$, via the Poisson equation lifting $z = A^{-1}y$	239
6.2	Implication on the uniform feedback stabilization of the boundary nonlinear dissipative feedback system w in (6.1.1a–c)	244
6.3	Implication on exact controllability of the (linear) dissipative system under boundary control	244
6.4	Asymptotic behavior of the transfer function: $(\widehat{B^*L})(\lambda) = \mathcal{O}(\lambda^{-(\frac{1}{2}-\varepsilon)})$, as positive $\lambda \nearrow +\infty$. A direct, independent proof	245
7	Euler–Bernoulli Plate with Clamped Boundary Controls. Neumann Boundary Control and Velocity Boundary Observation	247
7.1	From the Neumann boundary control of the Euler–Bernoulli plate to the boundary observation $-\mathbb{A}z _R$, via the Poisson lifting $z = \mathcal{A}^{-1}v_t$	247
7.2	Implication on the uniform feedback stabilization of the boundary nonlinear dissipative feedback system w in (7.1.1a–d)	254
7.3	Implication on exact controllability of the (linear) dissipative system under boundary control	255
8	Euler–Bernoulli Plate with Hinged Boundary Controls. Boundary Control in the ‘Moment’ Boundary Condition and Suitably Lifted Velocity Boundary Observation	256
8.1	From the ‘moment’ boundary control of the Euler–Bernoulli plate to the boundary observation $\frac{\partial z_t}{\partial \nu} _R$, via an elliptic lifting $z_t = \mathcal{A}^{-1}v_t$	256
8.2	Implication on the uniform feedback stabilization of the boundary nonlinear dissipative feedback system w in (8.1.1a–d)	262
8.3	Implication on exact controllability of the (linear) dissipative system under boundary control	262
8.4	Asymptotic behavior of the transfer function $(\widehat{B^*L})(\lambda) = \mathcal{O}(\lambda^{-(\frac{1}{2}+\varepsilon)})$, as positive $\lambda \nearrow +\infty$. A direct, independent proof	263
9	The Multidimensional Schrödinger Equation with Neumann Boundary Control on the State Space $H^1(\Omega)$ and on the State Space $L_2(\Omega)$	265
9.1	Exact controllability/uniform stabilization in $H^1(\Omega)$, $\dim \Omega \geq 1$	265
9.2	Exact controllability/uniform stabilization in $L_2(\Omega)$, $\dim \Omega \geq 1$	266

9.3	Counterexample for the multidimensional Schrödinger equation with Neumann boundary control: $L \notin \mathcal{L}(L_2(0, T; L_2(\Gamma); L_2(0, T; H^\varepsilon(\Omega))), \varepsilon > 0$. <i>A fortiori</i> : $B^*L \notin \mathcal{L}(L_2(0, T; U))$, with B^* related to the state space $H^\varepsilon(\Omega)$ and control space $U = L_2(\Gamma)$	267
9.4	The operator B^*L , with $U = L_2(\Gamma)$ and state space $L_2(\Omega)$ of the open-loop y -problem (9.1.1a–d) .	270

Uniform Asymptotics of Green's Kernels for Mixed and Neumann Problems in Domains with Small Holes and Inclusions 277

Vladimir Maz'ya and Alexander Movchan

1	Introduction	277
2	Green's Kernel for a Mixed Boundary Value Problem in a Planar Domain with a Small Hole or a Crack	280
2.1	Special solutions of model problems	280
2.2	The dipole matrix $\mathcal{P}$	282
2.3	Pointwise estimate of a solution to the exterior Neumann problem	283
2.4	Asymptotic properties of the regular part of the Neumann function in $\mathbb{R}^2 \setminus F$	286
2.5	Maximum modulus estimate for solutions to the mixed problem in Ω_ε with the Neumann data on ∂F_ε	288
2.6	Approximation of Green's function $G_\varepsilon^{(N)}$	290
2.7	Simpler asymptotic formulas for Green's function $G_\varepsilon^{(N)}$	292
3	Mixed Boundary Value Problem with the Dirichlet Condition on ∂F_ε	293
3.1	Special solutions of model problems	294
3.2	Asymptotic property of the regular part of Green's function in $\mathbb{R}^2 \setminus F$	296
3.3	Maximum modulus estimate for solutions to the mixed problem in Ω_ε with the Dirichlet data on ∂F_ε	297
3.4	Approximation of Green's function $G_\varepsilon^{(D)}$	299
3.5	Simpler asymptotic representation of Green's function $G_\varepsilon^{(D)}$	301
4	The Neumann Function for a Planar Domain with a Small Hole or Crack	303
4.1	Special solutions of model problems	303
4.2	Maximum modulus estimate for solutions to the Neumann problem in Ω_ε	304
4.3	Asymptotic approximation of N_ε	306

4.4	Simpler asymptotic representation of the Neumann function N_ε	308
5	Asymptotic approximations of Green's kernels for mixed and Neumann problems in three dimensions	309
5.1	Special solutions of model problems in limit domains	309
5.2	Approximations of Green's kernels	312
	References	315
	Finsler Structures and Wave Propagation	317
	Michael Taylor	
1	Introduction	317
2	Finsler Metrics and Finsler Symbols	319
3	Finsler Symbols, Pseudodifferential Operators, and Hyperbolic PDEs	321
4	Katok's Construction and Its Harmonic Analysis Counterpart	325
5	Appendix. Randers–Randers Duality	333
	References	334
