

Contents

1	Hyperbolic equations. Method of characteristics	1
1	Derivation of the d'Alembert equation	1
2	The d'Alembert method for infinite string	7
3	Analysis of the d'Alembert formula	12
4	Second-order hyperbolic equations in the plane	19
5	Semi-infinite string	30
6	Finite string	44
7	Wave equation with many independent variables	46
8	General hyperbolic equations	56
2	The Fourier method	65
9	Derivation of the heat equation	65
10	Mixed problem for the heat equation	67
11	The Sturm – Liouville problem	68
12	Eigenfunction expansions	74
13	The Fourier method for the heat equation	78
14	Mixed problem for the d'Alembert equation	83
15	The Fourier method for nonhomogeneous equations	86
16	The Fourier method for nonhomogeneous boundary conditions	93
17	The Fourier method for the Laplace equation	95
3	Distributions and Green's functions	105
18	Motivation	105
19	Distributions	109
20	Operations on distributions	110
21	Differentiation of jumps and the product rule	115
22	Fundamental solutions of ordinary differential equations	118
23	Green's function on an interval	121
24	Solvability condition for the boundary value problems	125
25	The Sobolev functional spaces	128
26	Well-posedness of the wave equation in the Sobolev spaces	130

27	Solutions to the wave equation in the sense of distributions	131
4	Fundamental solutions and Green's functions in higher dimensions . .	133
28	Fundamental solutions of the Laplace operator in \mathbb{R}^n	133
29	Potentials and their properties	137
30	Computing potentials via the Gauss theorem	143
31	Method of reflections	144
32	Green's functions in 2D via conformal mappings	149
A	Classification of the second-order equations	155
	References	159
