

## Correction

On page 118 I claim that " $v(105) = v(3.5.7) = 1$ ", this is incorrect, it should say that " $v(255) = v(3.5.17) = 1$ ", the remaining claims are correct. Following on from this there is an extra problem:

Show that there are two non-isomorphic groups of order 105, one which is Abelian and another,  $H$  say, which is not. Secondly, show that all of the proper subgroups of  $H$  bar one are cyclic, and that its centre, derived, Frattini and Fitting subgroups are all distinct from one-another. [Hint. Use Theorem 6.18.]
