

Table of contents

1. Heat release in the reactor core.....	1
1.1 Thermal power and thermal power density.....	1
1.2 Thermal power density and fuel material	4
1.3 Thermal power density and moderator temperature	5
1.4 Spatial distribution of the thermal power density	6
1.5 Equalizing of the spatial distribution of the thermal power density.....	8
1.6 Nomenclature.....	12
References.....	13
 2. Temperature inside the fuel elements.....	 15
2.1 Steady state temperature field	15
2.2 Transient temperature field.....	23
2.3 Influence of the cladding oxidation, hydrogen diffusion and of the corrosion product deposition.....	28
2.3.1 Cladding oxidation.....	28
2.3.2 Hydrogen diffusion	29
2.3.3 Deposition	29
2.4 Nomenclature.....	30
References.....	31
 3. The “simple” steady boiling flow in a pipe.....	 33
3.1 Mass conservation.....	35
3.2 Mixture momentum equation.....	36
3.3 Energy conservation	39
3.4 The idea of mechanical and thermodynamic equilibrium	41
3.5 Relaxing the assumption of mechanical equilibrium	42
3.6 Relaxing the assumption of thermodynamic equilibrium	43
3.7 The relaxation method	45
3.8 The boundary layer treatment	50
3.9 The boundary layer treatment with considered variable effective bubble size	52
3.10 Saturated flow boiling heat transfer	56
3.11 Combining the asymptotic method with boundary layer treatment allowed for variable effective bubble size	60

3.12 Separated momentum equations and bubble dynamics	60
3.13 Nomenclature.....	68
References	71
Appendix 3.1: The Sani's (1960) data for flow boiling in pipe	73
4. The “simple” steady three-fluid boiling flow in a pipe.....	77
4.1 Flow regime transition slug to churn turbulent flow.....	78
4.2 Instantaneous liquid redistribution in film and droplets	79
4.3 Relaxing the assumption for instantaneous liquid redistribution in film and droplets, entrainment and deposition	81
4.4 Drift flux correlations	84
4.5 Separated momentum equation.....	86
4.6 Dynamic evolution of the mean droplet size	89
4.6.1 Droplet size stability limit.....	89
4.6.2 Droplet production rate due to fragmentation.....	90
4.6.3 Duration of the fragmentation.....	90
4.6.4 Collision and coalescence.....	92
4.7 Heat transfer	93
4.8 Mass transfer.....	95
4.9 Comparison with experiments	98
4.10 Nomenclature.....	102
References	105
5. Core thermal hydraulic.....	107
5.1 Reactor pressure vessels	107
5.2 Steady state flow in heated rod bundles.....	114
5.2.1 The NUPEC experiment.....	114
5.2.2 The SIEMENS void data for the ATRIUM 10 fuel bundle	133
5.2.3. The FRIGG experiment	133
5.2.4. The THTF experiments: high pressure and low mass flow	139
5.3 Pressure drop for boiling flow in bundles.....	144
5.4 Transient boiling.....	147
5.4.1 The NUPEC transients in a channel simulating one sub-channel of a PWR fuel assembly	147
5.4.2 The NUPEC transients in PWR 5×5 fuel assembly	152
5.5 Steady state critical heat flux.....	156
5.5.1 Initial 0D-guess.....	157
5.5.2 3D-CHF analysis	162
5.5.3 Uncertainties	164
5.6 Outlook – towards the large scale turbulence modeling in bundles.....	171
5.7 Outlook – towards the fine resolution analysis.....	174
5.8 Core analysis.....	175
5.9 Nomenclature.....	179
References	181
Appendix 5.1: Some relevant constitutive relationship addressed in this analysis	185

6. Flow boiling and condensation stability analysis	189
6.1 State of the art	189
6.2 AREVA boiling stability data for the ATRIUM 10B fuel bundle	191
6.3 Flow condensation stability	196
References.....	204
7. Critical multiphase flow	207
7.1 Definition of the criticality condition.....	207
7.2 Grid structure.....	210
7.3 Iteration strategy	212
7.4 Single phase flow in pipe.....	212
7.4.1 No friction energy dissipation, constant cross section	212
7.4.2 General case, perfect gas.....	219
7.5 Simple two phase cases for pipes and nozzles	221
7.5.1 Subcooled critical mass flow rate in short pipes, orifices and nozzles.....	224
7.5.1 Frozen homogeneous non-developed flow	225
7.5.2 Non-homogeneous developed flow without mass exchange	228
7.5.3 Equilibrium homogeneous flow	229
7.5.4 Equilibrium non-homogeneous flow	248
7.5.5 Inhomogeneous developing flow in short pipes and nuzzles with infinitely fast heat exchange and with limited interfacial mass transfer ..	261
7.6 Recent state of the knowledge for describing critical flow	269
7.6.1 Bubbles origination.....	269
7.6.2 Bubble fragmentation.....	276
7.6.3 Bubble coalescences	278
7.6.4 Droplets origination	278
7.7 Examples for application of the theory of the critical flow.....	279
7.7.1 Blow down from initially closed pipe.....	279
7.7.2 Blow down from initially closed vessel.....	283
7.8 Nomenclature.....	285
References.....	289
8. Steam generators	293
8.1 Introduction.....	293
8.2 Some popular designs of steam generators	294
8.2.1 U-tube type	294
8.2.2 Once through type.....	301
8.2.3 Other design types.....	301
8.3 Frequent problems	301
8.4 Analytical tools	302
References.....	304

9. Moisture separation	307
9.1 Introduction	307
9.2 Moisture characteristics	311
9.3 Simple methods for computation of the efficiency of the separation	314
9.3.1 Cyclone separators.....	315
9.3.2 Vane separators.....	323
9.4 Velocity fields modeling in separators	329
9.4.1 <i>Kreith</i> and <i>Sonju</i> solution for the decay of turbulent swirl in pipe.....	329
9.4.2 Potential gas flow in vanes	330
9.4.3 Trajectory of particles in a known continuum field	331
9.4.4 CFD analyses of cyclones.....	334
9.4.5 CFD analyses of vane separators	334
9.5 Experiments.....	337
9.5.1 BWR cyclones, PWR steam generator cyclones.....	337
9.5.2 Other cyclone types	349
9.5.3 Vane dryers	354
9.6 Moisture separation in NPP with PWR's analyzed by three fluid models	365
9.6.1 Separation efficiency of the specific cyclone design	367
9.6.2 Efficiency of the specific vane separators design	368
9.6.3 Uniformity of the flow passing the vane separators.....	369
9.6.4 Efficiency of the condensate removal locally and integrally	370
9.7 Nomenclature.....	371
References	374
10. Pipe networks.....	377
10.1 Some basic definitions.....	379
10.1.1 Pipes.....	379
10.1.2 Axis in the space	381
10.1.3 Diameters of pipe sections	382
10.1.4 Reductions	383
10.1.5 Elbows	383
10.1.6 Creating a library of pipes.....	384
10.1.7 Sub system network	384
10.1.8 Discretization of pipes	385
10.1.9 Knots.....	386
10.2 The 1983-Interatome experiments	388
10.2.1 Experiment 1.2.....	389
10.2.2 Experiment 1.3.....	390
10.2.3 Experiment 10.6.....	393
10.2.4 Experiment 11.3.....	394
10.2.5 Experiment 21.....	396
10.2.6 Experiment 5.....	398
10.2.7 Experiment 15.....	400
References	403

11. Some auxiliary systems	405
11.1 High pressure reduction station.....	405
11.2 Gas release in research reactors piping	408
11.2.1 Solubility of O ₂ , N ₂ and H ₂ under 1 bar pressure.....	409
11.2.2 Some general remarks on the gas release- and absorption dynamics.....	410
11.2.3 Gas release in the siphon safety pipe	411
11.2.4 Radiolysis gases: generation, absorption and release.....	412
11.2.5 Mixing in the water pool.....	415
11.2.6 Computational analyses	415
References.....	421
12. Emergency condensers	423
12.1 Introduction.....	423
12.2 Simple mathematical illustration of the operation of the system	424
12.3 Performance of the condenser as a function of the water level and pressure	427
12.4 Condensate removal.....	427
13. Core degradation	429
13.1 Processes during the core degradation depending on the structure temperature	429
13.2 Analytical tools for estimation of the core degradation	430
References.....	431
14. Melt-coolant interaction.....	435
14.1 Melt-coolant interaction analysis for the boiling water reactor KARENA	436
14.1.1 Interaction inside the guide tubes.....	442
14.1.2 Melt-relocation through the lower core grid	444
14.1.3 Side melt-relocation through the core barrel.....	445
14.1.4 Late water injection.....	445
14.2 Pressure increase due to the vapor generation at the surface of the melt pool.....	445
14.3 Conditions for water penetration into melt	446
14.4 Vessel integrity during the core relocation phase	447
References.....	449
15. Coolability of layers of molten reactor material.....	453
15.1. Introduction.....	455
15.2. Problem definition	455
15.3. System of differential equations describing the process	456
15.3.1 Simplifying assumptions.....	456
15.3.2 Mass conservation.....	457
15.3.3 Gas release and gas volume fraction	459
15.3.4 Viscous layer.....	460

15.3.5 Crust formation	462
15.3.6 Melt energy conservation.....	464
15.3.7 Buoyancy driven convection.....	466
15.3.8 Film boiling	468
15.4 Heat conducting structures.....	469
15.4.1 Heat conduction through the structures	469
15.4.2 Boundary conditions	470
15.4.3 Oxide crust formation on colder heat conducting structures.....	471
15.5 Metal layer.....	474
15.6 Test case	474
15.6.1 Oxide over metal.....	475
15.6.2 Oxide besides metal	478
15.7 Gravitational flooding of hot solid horizontal surface by water	479
15.7.1 Simplifying assumptions.....	480
15.7.2 Conservation of mass and momentum, scaling	482
15.7.3 Eigen values, eigen vectors and canonical forms.....	485
15.7.4 Steady state	489
15.8 Nomenclature.....	491
15.9 Nomenclature to Sect. 15.7.....	493
References	495
16. External cooling of reactor vessels during severe accident.....	497
16.1 Introduction	497
16.2 State of the art.....	498
16.3 Dry core melting scenario, melt relocation, wall attack, focusing effect	500
16.4 Model assumptions and brief model description	501
16.4.1 Molten pool behavior.....	502
16.4.2 Two dimensional heat conduction through the vessel wall.....	503
16.4.3 Boundary conditions	504
16.4.4 Total heat flow from the pools into the vessel wall	506
16.4.5 Vessel wall ablation	507
16.4.6 Heat fluxes and crust formation	508
16.4.7 Buoyancy convection.....	509
16.5 Critical heat flux	525
16.6 Application examples of the model	530
16.6.1 The effect of vessel diameter	531
16.6.2 The effect of the lower head radius.....	531
16.6.3 The effect of the relocation time	533
16.6.4 The effect of the mass of the internal structures	533
16.6.5 Some important parameters characterizing the process	533
16.7 Nomenclature.....	538
References	540
Appendix 1: Some geometrical relations.....	544

17. Thermo-physical properties for severe accident analysis	549
17.1 Introduction.....	551
17.1.1 Summary of the properties at the melting line at atmospheric pressure.....	551
17.1.2 Approximation of the liquid state of melts.....	553
17.1.3 Nomenclature	556
References.....	558
17.2 Uranium dioxide caloric and transport properties.....	559
17.2.1 Solid	560
17.2.2 Liquid.....	568
17.2.3 Vapor	575
References.....	577
17.3 Zirconium dioxide.....	579
17.3.1 Solid	579
17.3.2 Liquid.....	584
References.....	587
17.4 Stainless steel.....	589
17.4.1 Solid	589
17.4.2 Liquid.....	596
17.4.3 Vapor	603
References.....	604
17.5 Zirconium	605
17.5.1 Solid	605
17.5.2 Liquid.....	611
References.....	615
17.6 Aluminum	617
17.6.1 Solid	617
17.6.2 Liquid.....	619
References.....	624
17.7 Aluminum oxide, Al_2O_3	627
17.7.1 Solid	627
17.7.2 Liquid.....	634
References.....	637
17.8 Silicon dioxide	639
17.8.1 Solid	639
17.8.2 Liquid.....	645
References.....	648
17.9 Iron oxide.....	651
17.9.1 Solid	651
17.9.2 Liquid.....	653
References.....	658
17.10 Molybdenum.....	659
17.10.1 Solid.....	659
17.10.2 Liquid.....	663
References.....	666

17.11 Boron oxide	667
17.11.1 Solid.....	667
17.11.2 Liquid	669
References	675
17.12 Reactor corium	677
17.12.1 Liquid	680
17.12.2 Solid.....	682
References	683
17.13 Sodium.....	685
17.13.1 Some basic characteristics	686
17.13.2 Liquid	690
17.13.3 Vapor.....	708
References	728
Appendix 1	729
17.14 Lead, bismuth and lead-bismuth eutectic alloy.....	731
