

Contents

1	Chemical Bonding in Solids	1
1.1	The Periodic Table of the Elements	1
1.2	Covalent Bonding	4
1.3	Ionic Bonding	9
1.4	Metallic Bonding	13
1.5	The Hydrogen Bond	15
1.6	The van der Waals Bond	15
	Problems	16
2	Structure of Solid Matter	21
2.1	The Crystal Lattice	22
2.2	Point Symmetry	25
2.3	The 32 Crystal Classes (Point Groups)	27
2.4	The Significance of Symmetry	28
2.5	Simple Crystal Structures	31
2.6	Phase Diagrams of Alloys	36
2.7	Defects in Solids	45
	Problems	48
3	Diffraction from Periodic Structures	51
3.1	General Theory of Diffraction	51
3.2	Periodic Structures and the Reciprocal Lattice	57
3.3	The Scattering Conditions for Periodic Structures	58
3.4	The Bragg Interpretation of the Laue Condition	60
3.5	Brillouin Zones	63
3.6	The Structure Factor	64
3.7	Methods of Structure Analysis	67
	Problems	70
	Panel I: Diffraction Experiments with Various Particles	72
	Panel II: X-Ray Interferometry and X-Ray Topography	78
4	Dynamics of Atoms in Crystals	83
4.1	The Potential	84
4.2	The Equation of Motion	85
4.3	The Diatomic Linear Chain	86

4.4	Scattering from Time-Varying Structures – Phonon Spectroscopy	91
4.5	Elastic Properties of Crystals	94
	Problems	104
	Panel III: Raman Spectroscopy	107
5	Thermal Properties	113
5.1	The Density of States	113
5.2	The Thermal Energy of a Harmonic Oscillator	116
5.3	The Specific Heat Capacity	118
5.4	Effects Due to Anharmonicity	120
5.5	Thermal Expansion	121
5.6	Heat Conduction by Phonons	124
	Problems	129
	Panel IV: Experiments at Low Temperatures	131
6	“Free” Electrons in Solids	135
6.1	The Free-Electron Gas in an Infinite Square-Well Potential	136
6.2	The Fermi Gas at $T = 0$ K	140
6.3	Fermi Statistics	142
6.4	The Specific Heat Capacity of Electrons in Metals	145
6.5	Electrostatic Screening in a Fermi Gas – The Mott Transition	150
6.6	Thermionic Emission of Electrons from Metals	152
	Problems	156
7	The Electronic Bandstructure of Solids	159
7.1	General Symmetry Properties	159
7.2	The Nearly Free-Electron Approximation	163
7.3	The Tight-Binding Approximation	167
7.4	Examples of Bandstructures	173
7.5	The Density of States	177
7.6	Density of States in Non-Crystalline Solids	179
	Problems	182
	Panel V: Photoemission Spectroscopy	184
8	Magnetism	191
8.1	Diamagnetism and Paramagnetism	191
8.2	The Exchange Interaction	196
8.3	Exchange Interaction Between Free Electrons	199
8.4	The Band Model of Ferromagnetism	201
8.5	The Temperature Behavior of a Ferromagnet in the Band Model	205
8.6	Ferromagnetic Coupling for Localized Electrons	209

8.7	Antiferromagnetism	211
8.8	Spin Waves	215
8.9	Crystalline Anisotropy	219
	Problems	225
	Panel VI: Magnetostatic Spin Waves	227
	Panel VII: Magnetism in Thin-Film Systems and GMR-Effect	233
9	Motion of Electrons and Transport Phenomena	241
9.1	Motion of Electrons in Bands and the Effective Mass	241
9.2	Currents in Bands and Holes	245
9.3	Scattering of Electrons in Bands	247
9.4	The Boltzmann Equation and Relaxation Time	251
9.5	The Electrical Conductivity of Metals	255
9.6	Thermoelectric Effects	261
9.7	The Wiedemann-Franz Law	264
9.8	Electrical Conductivity of Localized Electrons	266
9.9	Quantum Transport in Nanostructures	268
	Problems	282
	Panel VIII: Quantum Oscillations and the Topology of Fermi Surfaces	285
10	Superconductivity	291
10.1	Some Fundamental Phenomena Associated with Superconductivity	291
10.2	Phenomenological Description by Means of the London Equations	296
10.3	Instability of the “Fermi Sea” and Cooper Pairs	299
10.4	The BCS Ground State	304
10.5	The Excitation Spectrum of a Superconductor	312
10.6	Consequences of the BCS Theory and Comparison with Experimental Results	317
10.7	Supercurrents and Critical Currents	321
10.8	Coherence of the BCS Ground State and the Meissner-Ochsenfeld Effect	324
10.9	Quantization of Magnetic Flux	329
10.10	Type II Superconductors	333
10.11	“High-Temperature” Superconductors	340
	Problems	349
	Panel IX: One-Electron Tunneling in Superconductor Junctions	352
	Panel X: Cooper-Pair Tunneling – The Josephson Effect	362
11	Dielectric Properties of Materials	371
11.1	The Dielectric Function	371
11.2	Absorption of Electromagnetic Radiation	374
11.3	The Dielectric Function for a Harmonic Oscillator	377

11.4	Longitudinal and Transverse Normal Modes	379
11.5	Surface Waves on a Dielectric	382
11.6	Reflectivity of a Dielectric Half-Space	384
11.7	The Local Field	385
11.8	The Polarization Catastrophe and Ferroelectrics	387
11.9	The Free-Electron Gas	389
11.10	Interband Transitions	391
11.11	Excitons	398
11.12	Dielectric Energy Losses of Electrons	400
	Problems	403
	Panel XI: Novel Optical Materials	407
	Panel XII: Infrared Spectroscopy	414
	Panel XIII: The Frustrated Total Reflection Method	417
12	Semiconductors	419
12.1	Data of a Number of Important Semiconductors	420
12.2	Charge Carrier Density in Intrinsic Semiconductors	424
12.3	Doping of Semiconductors	428
12.4	Carrier Densities in Doped Semiconductors	432
12.5	Conductivity of Semiconductors	437
12.6	The p - n Junction and the Metal/Semiconductor Schottky Contact	443
12.7	Semiconductor Heterostructures and Superlattices	459
12.8	Important Semiconductor Devices	472
	Problems	486
	Panel XIV: The Hall Effect	489
	Panel XV: Cyclotron Resonance in Semiconductors	492
	Panel XVI: Shubnikov-de Haas Oscillations and Quantum Hall Effect	495
	Panel XVII: Semiconductor Epitaxy	504
	Panel XVIII: Preparation of Nanostructures	510
	References	517
	Index	527

Solid-State Physics

An Introduction to Principles of Materials Science

Ibach, H.; Lüth, H.

2009, XIV, 536 p., Softcover

ISBN: 978-3-540-93803-3
