Preface	xi
----------------------	----

Part I Single-Objective Optimization

1 Scarcity and Efficiency	3
1.1 The Mathematical Programming Problem	4
1.2 Mathematical Programming Models in Economics	4
1.2.1 The Diet Problem	4
1.2.2 The Neoclassical Theory of the Household	6
1.2.3 The Neoclassical Theory of the Firm	7
1.2.4 The Theory of Comparative Advantage	9
1.2.5 The Giffen Paradox	9
1.2.6 The Transportation Problem	10
1.2.7 Portfolio Selection Model	11
1.2.8 Input–Output Analysis and Mathematical Programming	12
1.2.9 Data Envelopment Analysis	17
1.3 Classification of Mathematical Programming Problems	18
References and Further Reading	22
2 Kuhn–Tucker Conditions	25
2.1 The Kuhn–Tucker Theorem	25
2.2 Rationale of the Kuhn–Tucker Conditions	31
2.3 Kuhn–Tucker Conditions and a Saddle Point of the Lagrange Function	32
2.4 Kuhn–Tucker Conditions for the General Mathematical Programming Problem	33
2.5 The Kuhn–Tucker Conditions and Economic Analysis	36
2.5.1 Peak Load Pricing	37
2.5.2 Revenue Maximization under a Profit Constraint	39

2.5.3	Behavior of the Firm under Regulatory Constraint	41
2.5.4	Environmental Regulation: The Effects of Different Restrictions	50
	References and Further Reading	56
3	Convex Programming	59
3.1	Basic Definitions and Properties	60
3.2	Kuhn–Tucker Conditions for a Convex Programming Problem	68
3.3	Duality Theory	73
3.4	Economic Interpretation of Duality in Convex Programming	78
	References and Further Reading	84
4	Linear Programming	87
4.1	The General Linear Programming Problem	87
4.2	Implications of Linearity Assumption for Economic Analysis	91
4.3	Duality in Linear Programming	93
4.4	The More-for-Less Paradox	101
4.5	Computational Procedure: The Simplex Method	107
4.6	Some Applications of Linear Programming in Economics	119
4.6.1	The Theory of Comparative Advantage	119
4.6.2	The Giffen Paradox	123
4.6.3	Leontief Pollution Model	127
	References and Further Reading	132
5	Data Envelopment Analysis	135
5.1	Productivity and Technical and Allocative Efficiency	136
5.2	Basic DEA Models	139
5.2.1	The Input-Oriented Model under a Constant Returns-to- Scale Assumption	140
5.2.2	The Output-Oriented Model under a Constant Returns-to-Scale Assumption	150
5.2.3	The Additive Model under a Constant Returns-to-Scale Assumption	153
5.2.4	DEA Models under a Variable Returns-to-Scale Assumption	158
5.3	Production Technologies and Efficiency Measurement	167
5.4	Technical versus Environmental Efficiency, or How to Measure Ecoefficiency	177
5.4.1	Composition of Technical and Environmental Efficiency	178
5.4.2	Comprehensive Measurement of Ecoefficiency	182
	References and Further Reading	184
6	Geometric Programming	187
6.1	The Principle of Geometric Programming	188
6.2	The Theory of Geometric Programming	189

6.3	Models of Geometric Programming in Economics	195
6.3.1	The Economic Lot Size Problem	196
6.3.2	The Minimization of Cost	197
6.3.3	The Economic Interpretation of Dual Variables as Elasticity Coefficients	200
6.3.4	An Open Input–Output Model with Continuous Substitution between Primary Factors	201
6.4	Transformation of Some Optimization Problems into Standard Geometric Programming Models	206
	References and Further Reading	209

Part II Multiobjective Optimization

7	Fundamentals of Multiobjective Optimization	213
7.1	Examples of Multiobjective Programming Models in Economics . . .	214
7.1.1	Welfare Economics	214
7.1.2	Quantitative Economic Policy	218
7.1.3	Optimal Monetary Policy	219
7.1.4	Optimal Behavior of a Monopolist Facing a Bicriteria Objective Function	221
7.1.5	Leontief Pollution Model with Multiple Objectives	222
7.1.6	A Nonlinear Model of Environmental Control	224
7.2	Kuhn–Tucker Conditions for the Multiobjective Programming Problem	225
7.3	Duality for Multiobjective Optimization Problems	232
7.3.1	Duality for Multiobjective Optimization Problems in Parametric Form	232
7.3.2	Duality Theory for Convex Lexicographic Programming . . .	233
7.4	Behavior of the Firm Facing a Bicriteria Objective Function under Regulatory Constraint	235
	References and Further Reading	237
8	Multiobjective Linear Programming	243
8.1	Linear Vector Optimization Problems	243
8.2	Duality in Multiple-Objective Linear Programming	248
8.3	Interactive Procedures and the Zions–Wallenius Method	257
8.4	The Leontief Pollution Model with Multiple Objectives	262
	References and Further Reading	267
9	Multiobjective Geometric Programming	271
9.1	Vector Minimization Problems in Geometric Programming	271
9.2	Duality for Multiobjective Geometric Programming in Parametric Form	275

9.3	A Nonlinear Model of Environmental Control	280
9.4	Optimal Behavior of a Monopolist Facing a Bicriteria Objective Function	283
	References and Further Reading	287
Index	289

Mathematical Optimization and Economic Analysis

Luptácik, M.

2010, XIV, 294 p. 53 illus., Hardcover

ISBN: 978-0-387-89551-2
