Preface	VII
1 Introduction	1
1.1 Overview and Latest Developments	1
1.2 Topics Receiving Particular Emphasis	2
1.3 Basic Background	3
1.4 Elementary Integral Facts	5

Part I Stochastic Theory

2 Probability	9
2.1 Random Variables	9
2.1.1 Probability distributions	10
2.2 Characteristic Functions	13
2.2.1 Convergence properties - 1	14
2.2.2 Convergence properties - 2	15
2.2.3 Characteristic function for a Cantor-like measure	16
2.2.4 An application of the characteristic function	17
2.3 Infinitely Divisible Distributions	18
2.3.1 Divisibility	19
2.3.2 Infinite divisibility	20
2.4 Central Limit Theorem—and Its Avoidance	21
3 Infinite-Dimensional Integrals	27
3.1 Basics	27
3.2 Support Properties	29
3.3 Characteristic Functional	30
3.4 Tightest Support Conditions	32
3.5 From Sequences to Functions	33
3.6 Bochner–Minlos Theorem	36

3.7	Functional Derivatives	38
3.8	Functional Fourier Transformations	39
3.9	Change of Variables	41
3.9.1	Change of infinitely many variables	43
4	Stochastic Variable Theory	47
4.1	General Remarks	47
4.1.1	Stationary processes	48
4.1.2	Ergodic processes	48
4.1.3	Gaussian examples	51
4.2	Wiener Process, a.k.a. Brownian Motion	52
4.2.1	Definition of a standard Wiener process	52
4.2.2	Continuity of Brownian paths	53
4.2.3	Stochastic equivalence	55
4.2.4	Independent increments	56
4.2.5	Some joint and conditional probability densities	57
4.2.6	Itô calculus	58
4.2.7	Stochastic integrals	59
4.3	Wiener Measure	61
4.3.1	General Wiener process	62
4.3.2	Pinned Brownian motion	63
4.3.3	Generalized Brownian bridges	63
4.3.4	Alternative Brownian bridges	64
4.4	The Feynman–Kac Formula	64
4.5	Ornstein–Uhlenbeck Process	66
4.5.1	Addition of a potential to an O-U process	67
4.6	Realization of a General Gaussian Process	67
4.7	Generalized Stochastic Process	69
4.7.1	Gaussian white noise	69
4.8	Stochastic Differential Equations a.k.a. Langevin Equations ...	71
4.9	Poisson Process	73

Part II Quantum Theory

5	Background to an Analysis of Quantum Mechanics	79
5.1	Hilbert Space and Operators: Basic Properties	79
5.1.1	Hilbert space	79
5.1.2	Fourier representation	81
5.1.3	L^2 representatives	81
5.1.4	Segal–Bargmann representation	83
5.1.5	Reproducing kernel Hilbert spaces	83
5.1.6	Operators for Hilbert space	86
5.2	Hilbert Space and Operators: Advanced Properties	90
5.3	Basic Lie Group Theory	95

5.3.1	Lie algebras	96
5.3.2	Invariant group measures	97
5.3.3	Group representations	98
5.4	Outline of Abstract Quantum Mechanics	102
5.4.1	Schrödinger picture	103
5.4.2	Heisenberg picture	104
6	Quantum Mechanical Path Integrals	107
6.1	Configuration Space Path Integrals	107
6.1.1	Schrödinger equation (special case)	107
6.1.2	The free particle	109
6.1.3	Quadratic path integrals	110
6.1.4	Harmonic oscillator	112
6.1.5	Eigenfunctions and eigenvalues	113
6.1.6	Connection with operators	114
6.1.7	Validity of the lattice space regularization	116
6.1.8	Classical symptoms of quantum illnesses	116
6.1.9	The question of a measure for the Feynman path integral	118
6.1.10	Proposal of Gel'fand and Yaglom to introduce a measure	118
6.1.11	Proposal of Itô to introduce a measure	120
6.2	Phase Space Path Integrals	121
6.2.1	Momentum space propagator	121
6.2.2	Physical interpretation of path integrals	123
6.2.3	Selected applications	124
6.2.4	Choice of canonical coordinates	128
6.3	Action Principle—and Equations of Motion	130
7	Coherent State Path Integrals	133
7.1	Canonical Coherent States and Their Properties	133
7.1.1	Coherent states—what are they?	133
7.1.2	Diagonal coherent state matrix elements	137
7.2	Coherent State Propagator	138
7.2.1	Change of coordinates	140
7.2.2	Metrics from coherent states	146
7.2.3	Coherent state path integrals—a one form and a metric	147
7.2.4	Alternative coherent state path integral construction ..	148
7.3	Many Degrees of Freedom	149
7.3.1	Configuration space path integrals	149
7.3.2	Phase space path integrals	150
7.3.3	Coherent state path integrals	151
7.4	Spin Coherent State Path Integrals	152
7.4.1	Spin coherent states	152

7.4.2	Spin dynamics and the spin coherent state path integral	154
7.5	Affine Coherent State Path Integrals	156
7.5.1	Affine coherent states	156
7.5.2	Affine dynamics and the affine coherent state path integral	158
7.6	Coherent State Path Integrals without a Resolution of Unity . .	159
8	Continuous-Time Regularized Path Integrals	161
8.1	Wiener Measure Regularization of Phase Space Path Integrals .	161
8.1.1	Covariance under canonical coordinate transformations .	163
8.1.2	Proof of Wiener measure path integral regularization . .	164
8.1.3	Multivariable Wiener measure regularization of path integrals	167
8.2	Continuous-Time Regularization of Spin Variable Path Integrals	168
8.3	Continuous-Time Regularization of Affine Variable Path Integrals	170
8.4	Quantization as Geometry	172
9	Classical and Quantum Constraints	175
9.1	Classical Systems with Constraints	175
9.1.1	General classical construction	177
9.1.2	Anomalous constraint situations	180
9.2	Quantum Theory of Constrained Systems	184
9.2.1	Dirac's procedure for quantization of systems with constraints	185
9.3	The Projection Operator Method	187
9.3.1	Observables and the classical limit	189
9.3.2	Basic examples of the projection operator method	190
9.3.3	Additional examples of the projection operator method .	195
9.3.4	Representation of the projection operator	199
9.3.5	A universal representation for the projection operator . .	201
9.4	Constrained Dynamics in Operator Form	203
9.5	Coherent State Path Integrals for Systems with Constraints . .	205

Part III Quantum Field Theory

10	Application to Quantum Field Theory	211
10.1	Introduction and Overview	211
10.1.1	Classical preliminaries	211
10.2	Relativistic Free Fields	212
10.2.1	A brief survey of classical and quantum properties	212
10.3	Functional Integral Formulation	215

10.4	Euclidean-Space Functional Integral Formulation	219
10.4.1	Local products	221
10.5	Interacting Scalar Fields	223
10.5.1	Perturbation theory	224
10.5.2	Spacetime dimension $n = 3$	226
10.5.3	Spacetime dimension $n = 4$	228
10.5.4	Spacetime dimension $n \geq 5$	231
10.6	Euclidean-Space Lattice Regularization	233
11	A Modern Approach to Nonrenormalizable Models	235
11.1	Introduction	235
11.2	Nonrenormalizable Classical Models	236
11.2.1	Relativistic models	236
11.2.2	Ultralocal models	236
11.2.3	Independent value models	237
11.2.4	Classical pseudofree models	237
11.3	Euclidean Space Functional Integrals—Preliminary Remarks . .	239
11.3.1	Independent value models	239
11.3.2	Ultralocal models	240
11.3.3	Solution of independent value models	241
11.3.4	Solution of ultralocal models	244
11.3.5	An alternative approach to both the IV and UL models—an overview with details to follow	248
11.4	An Alternative Method to Solve the IV and UL Models	249
11.4.1	A reexamination of IV models	249
11.4.2	A reexamination of UL models	253
11.5	Relativistic Nonrenormalizable Scalar Models	254
11.5.1	Motivation for alternative studies of relativistic nonrenormalizable models	255
11.5.2	The free ground state distribution	256
11.5.3	Properties of the matrix A_{k-l}	257
11.5.4	Mass-like moments in the ground state distribution . . .	258
11.5.5	Mashing the relativistic measure	258
11.5.6	Lattice Hamiltonian for the free and pseudofree models	260
11.5.7	The importance of sharp time moments	262
11.5.8	Statement of the fundamental problem	263
11.6	The Continuum Limit, and Term-by-Term Finiteness of a Perturbation Analysis	264
11.6.1	Field strength renormalization	264
11.6.2	Mass and coupling constant renormalization	265
11.7	Conclusion	266
	References	269
