Preface	ix
0. Introduction	1
1. Preliminaries	
1.1. Distribution densities on manifolds	8
1.2. The method of stationary phase	10
1.3. The wave front set of a distribution	15
2. Local Theory of Fourier Integrals	
2.1. Symbols	23
2.2. Distributions defined by oscillatory integrals	28
2.3. Oscillatory integrals with nondegenerate phase functions	30
2.4. Fourier integral operators (local theory)	37
2.5. Pseudodifferential operators in \mathbb{R}^n	41
3. Symplectic Differential Geometry	
3.1. Vector fields	45
3.2. Differential forms	49
3.3. The canonical 1- and 2-form in $T^*(X)$	56
3.4. Symplectic vector spaces	58
3.5. Symplectic differential geometry	69
3.6. Lagrangian manifolds	75
3.7. Conic Lagrangian manifolds	82
3.8. Classical mechanics and variational calculus	86
4. Global Theory of Fourier Integral Operators	
4.1. Invariant definition of the principal symbol	91
4.2. Global theory of Fourier integral operators	97
4.3. Products with vanishing principal symbol	104
4.4. L^2 -continuity	107
5. Applications	
5.1. The Cauchy problem for strictly hyperbolic differential operators with C^∞ coefficients	113
5.2. Oscillatory asymptotic solutions. Caustics	127
References	138
