

Contents

1	Vectors	1
1.1	Introduction	1
1.2	Vectors as arrows	1
1.3	Vector fields	3
1.4	Calculus of vectors. Two dimensions	5
1.5	Three and more dimensions	11
1.6	The vector product	14
1.7	Space and metric	16
2	Differential calculus	21
2.1	Differentiation	21
2.2	Calculation of slopes of tangent lines	25
2.3	Geometry of second derivatives	27
2.4	The product rule	28
2.5	The chain rule	29
2.6	The derivative of a power function	31
2.7	Differentiation of fractions	32
2.8	Functions of several variables	33
2.9	The MacLaurin and the Taylor series expansions	38
3	Tangent vectors	43
3.1	Parametric description of curves	43
3.2	Parametrization of a straight line	46
3.3	Tangent vector fields	47
3.4	Differential equations and Newton's 2. law	50
3.5	Integration	51
3.6	Exponential and logarithmic functions	54
3.7	Integrating equations of motion	58

4	Approaching general relativity: introducing curvilinear coordinate systems	61
4.1	Trigonometric functions	62
4.1.1	Differentiation of trigonometric functions	69
4.2	Plane polar coordinates	71
5	The metric tensor	77
5.1	Basis vectors and the dimension of a space	77
5.2	Space and spacetime	79
5.3	Transformation of vector components	80
5.4	The Galilean coordinate transformation	84
5.5	Transformation of basis vectors	87
5.6	Covariant and contravariant vector components	88
5.7	Tensors	89
5.8	The metric tensor	92
5.9	Covariant and contravariant tensor components	97
5.10	The Lorentz transformation	100
5.11	The relativistic time dilation	106
5.12	The line element	108
5.13	Minkowski diagrams and light cones	113
5.14	The spacetime interval	115
5.15	The general formula for the line element	120
5.16	Epistemological comment	123
5.17	Kant or Einstein: are space and time human inventions?	125
6	The Christoffel symbols	129
6.1	Geometrical calculation of the Christoffel symbols of plane polar coordinates	130
6.2	Algebraic calculation of Christoffel symbols	136
6.3	Spherical coordinates	138
6.4	Symmetry of the Christoffel symbols	143
7	Covariant differentiation	145
7.1	Variation of vector components	145
7.2	The covariant derivative	148
7.3	Transformation of covariant derivatives	153
7.4	Covariant differentiation of covariant tensor components	154
7.5	Christoffel symbols expressed by the metric tensor	156
8	Geodesics	159
8.1	Generalizing 'flat space concepts' to 'curved and flat space concepts'	159
8.2	Parallel transport: unexpected difficulties	160
8.3	Definition of parallel transport	162
8.4	The general geodesic equation	163
8.5	Local Cartesian and geodesic coordinate systems	166

9	Curvature	169
9.1	The curvature of plane curves	169
9.2	The curvature of surfaces	172
9.3	Curl	179
9.4	The Riemann curvature tensor	181
10	Conservation laws of classical mechanics	187
10.1	Introduction	187
10.2	Divergence	188
10.3	The equation of continuity	191
10.4	The stress tensor	193
10.5	The net surface force acting on a fluid element	195
10.6	The material derivative	198
10.7	The equation of motion	200
10.8	Four-velocity	200
10.9	Newtonian energy-momentum tensor of a perfect fluid	203
10.10	Mathematical formulation of the basic conservation laws	205
10.11	Relativistic energy-momentum of a perfect fluid	208
11	Einstein's field equations	211
11.1	A new conception of gravitation	211
11.2	The Ricci curvature tensor	212
11.3	The Bianchi identity, conservation of energy, and Einstein's tensor	217
12	Einstein's theory of spacetime and gravitation	225
12.1	Newtonian kinematics	225
12.2	Forces	226
12.2.1	Newton's three laws	227
12.3	Newton's theory of gravitation	229
12.4	Consequences of special relativity for a theory of gravitation	230
12.5	The general theory of relativity	235
12.6	The Newtonian limit of general relativity	242
12.7	Repulsive gravitation	247
12.8	The 'geodesic postulate' derived from the field equations	249
12.9	Constants of motion	251
12.10	The conceptual structure of the general theory of relativity	252
12.11	General relativity versus Newton's theory of gravitation	253
12.12	Epistemological comment	255
13	Some applications of the general theory of relativity	257
13.1	Rotating reference frame	258
13.2	The gravitational time dilation	259
13.3	The Schwarzschild solution	263
13.4	The Pound–Rebka experiment	268
13.5	The Hafele–Keating experiment	269
13.6	Mercury's perihelion precession	273

13.7	Gravitational deflection of light	277
13.8	Black holes	281
14	Relativistic universe models	289
14.1	Observations	289
14.2	Homogeneous and isotropic universe models	291
14.3	Einstein's gravitational field equations for homogeneous and isotropic world models	294
14.4	Physical properties of the Friedmann models	297
14.5	The matter and radiation dominated periods	302
14.6	Problems faced by the standard model of the universe	305
14.7	Inflationary cosmology	306
A	The Laplacian in a spherical coordinate system	313
B	The Ricci tensor of a static and spherically symmetric spacetime	319
C	The Ricci tensor of the Robertson–Walker metric	327
	References	331

Einstein's Theory

A Rigorous Introduction for the Mathematically
Untrained

Gron, O.; Naess, A.

2011, XVII, 341 p., Hardcover

ISBN: 978-1-4614-0705-8
