## Part I Fundamental Concepts

|                                                                                                       |            |
|-------------------------------------------------------------------------------------------------------|------------|
| <b>Cytoskeletal Mechanics and Cellular Mechanotransduction:<br/>A Molecular Perspective . . . . .</b> | <b>3</b>   |
| Hamed Hatami-Marbini and Mohammad R. K. Mofrad                                                        |            |
| <b>Forces During Cell Adhesion and Spreading:<br/>Implications for Cellular Homeostasis . . . . .</b> | <b>29</b>  |
| Shawn P. Carey, Jonathan M. Charest and Cynthia A. Reinhart-King                                      |            |
| <b>The Physical Mechanical Processes that Shape Tissues<br/>in the Early Embryo . . . . .</b>         | <b>71</b>  |
| Lance A. Davidson                                                                                     |            |
| <b>Mechanobiology of Primary Cilia . . . . .</b>                                                      | <b>99</b>  |
| Ronald Y. Kwon, David A. Hoey and Christopher R. Jacobs                                               |            |
| <b>Mechanical Response of Living Cells to Contacting Shear Forces . . . .</b>                         | <b>125</b> |
| Alison C. Dunn, W. Gregory Sawyer, Malisa Sarntinoranont<br>and Roger Tran-Son-Tay                    |            |

## Part II Experimental Methods

|                                                                                                    |            |
|----------------------------------------------------------------------------------------------------|------------|
| <b>Microfabricated Devices for Studying Cellular<br/>Biomechanics and Mechanobiology . . . . .</b> | <b>145</b> |
| Christopher Moraes, Yu Sun and Craig A. Simmons                                                    |            |

|                                                                                                         |            |
|---------------------------------------------------------------------------------------------------------|------------|
| <b>Nanotechnology Usages for Cellular Adhesion and Traction Forces . . . . .</b>                        | <b>177</b> |
| Sangyoon J. Han and Nathan J. Sniadecki                                                                 |            |
| <b>The Mechanical Environment of Cells in Collagen Gel Models . . . . .</b>                             | <b>201</b> |
| Kristen L. Billiar                                                                                      |            |
| <b>Biomechanical Characterization of Single Chondrocytes . . . . .</b>                                  | <b>247</b> |
| Johannah Sanchez-Adams and Kyriacos A. Athanasiou                                                       |            |
| <b>Mechanics of Airway Smooth Muscle Cells and the Response to Stretch . . . . .</b>                    | <b>267</b> |
| Geoffrey N. Maksym                                                                                      |            |
| <br><b>Part III Computational Modeling</b>                                                              |            |
| <b>Biomechanical Modelling of Cells in Mechanoregulation . . . . .</b>                                  | <b>297</b> |
| Alexander B. Lennon, Hanifeh Khayyeri, Feng Xue and Patrick J. Prendergast                              |            |
| <b>Finite Element Modeling of Cellular Mechanics Experiments . . . . .</b>                              | <b>331</b> |
| Noa Slomka and Amit Gefen                                                                               |            |
| <b>Multiscale Computation of Cytoskeletal Mechanics During Blebbing . . . . .</b>                       | <b>345</b> |
| Sorin Mitran and Jennifer Young                                                                         |            |
| <b>Mechanobiology and Finite Element Analysis of Cellular Injury During Microbubble Flows . . . . .</b> | <b>373</b> |
| Samir N. Ghadiali and Hannah L. Dailey                                                                  |            |
| <b>Mathematical Modelling of Cell Adhesion in Tissue Engineering using Continuum Models . . . . .</b>   | <b>431</b> |
| Liesbet Geris and Alf Gerisch                                                                           |            |
| <b>Cell–Material Communication: Mechanosensing Modelling for Design in Tissue Engineering . . . . .</b> | <b>451</b> |
| J. M. García-Aznar, J. A. Sanz-Herrera and P. Moreo                                                     |            |

**Part IV   Mechanobiology in Cancer**

|                                                                                                               |            |
|---------------------------------------------------------------------------------------------------------------|------------|
| <b>Structure–Mechanical Property Changes in Nucleus arising<br/>from Breast Cancer. . . . .</b>               | <b>465</b> |
| Qingsen Li and Chwee Teck Lim                                                                                 |            |
| <b>Adhesion and Signaling of Tumor Cells to Leukocytes<br/>and Endothelium in Cancer Metastasis . . . . .</b> | <b>477</b> |
| Cheng Dong                                                                                                    |            |
| <b>Cellular Mechanics of Acute Leukemia and Chemotherapy . . . . .</b>                                        | <b>523</b> |
| Wilbur A. Lam and Daniel A. Fletcher                                                                          |            |
| <b>Author Index . . . . .</b>                                                                                 | <b>559</b> |
