Introduction	1
Part I General and Convex Problems	
1 A complete lattice for vector optimization	7
1.1 Partially ordered sets and complete lattices	8
1.2 Conlinear spaces	11
1.3 Topological vector spaces	13
1.4 Infimal and supremal sets	19
1.5 Hyperspaces of upper closed sets and self-infimal sets	25
1.6 Subspaces of convex elements	29
1.7 Scalarization methods	34
1.8 A topology on the space of self-infimal sets	37
1.9 Notes on the literature	41
2 Solution concepts	43
2.1 A solution concept for lattice-valued problems	45
2.2 A solution concept for vector optimization	51
2.3 Semicontinuity concepts	55
2.4 A vectorial Weierstrass theorem	61
2.5 Mild solutions	62
2.6 Maximization problems and saddle points	67
2.7 Notes on the literature	73
3 Duality	75
3.1 A general duality concept applied to vector optimization	76
3.2 Conjugate duality	78
3.2.1 Conjugate duality of type I	79
3.2.2 Duality result of type II and dual attainment	83
3.2.3 The finite dimensional and the polyhedral case	91
3.3 Lagrange duality	92

3.3.1	The scalar case	93
3.3.2	Lagrange duality of type I	95
3.3.3	Lagrange duality of type II	98
3.4	Existence of saddle points	102
3.5	Connections to classic results	103
3.6	Notes on the literature	106
 Part II Linear Problems		
4	Solution concepts and duality	111
4.1	Scalarization	112
4.1.1	Basic methods	112
4.1.2	Solutions of scalarized problems	114
4.2	Solution concept for the primal problem	116
4.3	Set-valued duality	122
4.4	Lattice theoretical interpretation of duality	130
4.5	Geometric duality	137
4.6	Homogeneous problems	151
4.7	Identifying faces of minimal vectors	156
4.8	Notes on the literature	158
5	Algorithms	161
5.1	Benson's algorithm	162
5.2	A dual variant of Benson's algorithm	169
5.3	Solving bounded problems	177
5.4	Solving the homogeneous problem	178
5.5	Computing an interior point of the lower image	190
5.6	Degeneracy	192
5.7	Notes on the literature	194
