

Contents

1	The Model	1
1.1	Newton's Law	3
1.2	Work and Energy	4
1.3	The Formalism of Lagrange	6
1.4	Oscillating Electrical Circuits	12
2	Simultaneous Diagonalisation (Modal Damping)	15
2.1	Undamped Systems	15
2.2	Frequencies as Singular Values	19
2.3	Modally Damped Systems	20
3	Phase Space	23
3.1	General Solution	23
3.2	Energy Phase Space	24
4	The Singular Mass Case	29
5	'Indefinite Metric'	39
5.1	Sylvester Inertia Theorem	41
6	Matrices and Indefinite Scalar Products	49
7	Oblique Projections	55
8	J-Orthogonal Projections	61
9	Spectral Properties and Reduction of J-Hermitian Matrices	67

10	Definite Spectra	73
11	General Hermitian Matrix Pairs	89
12	Spectral Decomposition of a General J-Hermitian Matrix	93
12.1	Condition Numbers	105
13	The Matrix Exponential	113
14	The Quadratic Eigenvalue Problem	121
15	Simple Eigenvalue Inclusions	129
16	Spectral Shift	135
17	Resonances and Resolvents	139
18	Well-Posedness	143
19	Modal Approximation	145
20	Modal Approximation and Overdampedness	159
20.1	Monotonicity-Based Bounds	162
21	Passive Control	167
21.1	More on Lyapunov Equations	170
21.2	Global Minimum of the Trace	172
21.3	Lyapunov Trace vs. Spectral Abscissa	178
22	Perturbing Matrix Exponential	185
23	Notes and Remarks	193
	References	203
	Index	207

Damped Oscillations of Linear Systems

A Mathematical Introduction

Veselić, K.

2011, XV, 200 p. 8 illus., Softcover

ISBN: 978-3-642-21334-2
