ANHA Series Preface	vii
Preface	ix
Preface to Volume 1	ix
Preface to Volume 2	xiv
10 Lie Groups I: Introduction and Examples	1
10.1 Introduction to Group Theory	2
10.1.1 Binary Operations	2
10.1.2 Groups, Groupoids, and Semi-groups	2
10.1.3 Subgroups	6
10.1.4 Group Actions and Transformation Groups	7
10.1.5 Cosets	8
10.1.6 Coset Spaces and Quotient Groups	9
10.1.7 Double-Coset Decompositions	10
10.1.8 Mappings Between Groups	10
10.1.9 Products of Groups	14
10.2 Matrix Lie Groups and Lie Algebras	16
10.2.1 A Usable Definition of Matrix Lie Groups	16
10.2.2 Broad Classes of Matrix Lie Groups	18
10.2.3 The Exponential and Logarithm Maps	18
10.2.4 The \vee Operator	20
10.2.5 The Adjoint Operator $Ad(g)$	20
10.2.6 The Lie Bracket and $ad(X)$	21
10.2.7 The Baker–Campbell–Hausdorff Formula	22
10.3 Change of Basis in a Matrix Lie Algebra	23
10.3.1 General Change of Basis	23
10.3.2 Invariance of Functions of Structure Constants	24
10.3.3 Changes of Basis Due to Adjoint Action	25
10.4 Inner Products on Matrix Lie Algebras	26
10.4.1 Calculating Jacobians	26
10.4.2 Invariant Vector Fields	27
10.5 Adjoint Matrices and the Killing Form	28
10.5.1 The Killing Form	28
10.5.2 The Matrices of $Ad(g)$, $Ad^*(g)$, $ad(X)$, and $B(X, Y)$	29

10.5.3	Relationship Between $ad(X)$ and $B(X, Y)$, and the Structure Constants	30
10.5.4	Conditions for Unimodularity	31
10.6	Examples	32
10.6.1	The Heisenberg Nilpotent Group	32
10.6.2	The Group of Rigid-Body Motions of the Euclidean Plane, $SE(2)$	34
10.6.3	The Group $SL(2, \mathbb{R})$	36
10.6.4	The Motion Group of the Lobachevsky Plane, $L(2)$	37
10.6.5	The Lorentz Group, $SO(2, 1)$	38
10.6.6	The Rotation Group, $SO(3)$	39
10.6.7	The Group $GL(2, \mathbb{R})$	42
10.6.8	The Scale-Euclidean Group of the Plane	42
10.6.9	$SE(3)$, The Group of Rigid-Body Motions	43
10.6.10	The Weyl–Heisenberg Group and Its Semidirect Product with $SL(2, \mathbb{R})$	45
10.7	Objects That Are Not Quite Groups	47
10.7.1	Case Study 1: Closure Can Fail	47
10.7.2	Case Study 2: Even If Closure Holds, Associativity Can Fail	48
10.7.3	Case Study 3: Another Example of When Associativity Can Fail	48
10.7.4	Case Study 4: Even If Associativity Holds Closure Doesn’t Have to	49
10.7.5	Case Study 5: An Identity and Inverse Need Not Exist Even When Associativity and Closure Hold	49
10.8	Chapter Summary	49
10.9	Exercises	50
	References	53
11	Lie Groups II: Differential-Geometric Properties	55
11.1	Defining Lie Derivatives	56
11.1.1	Left Versus Right	56
11.1.2	Derivatives for $SO(3)$	57
11.2	Important Properties of Lie Derivatives	57
11.2.1	The Product Rule	58
11.2.2	The Chain Rule (Version 1)	58
11.3	Taylor Series on Lie Groups	59
11.3.1	Classical Taylor Series and Polynomial Approximation in \mathbb{R}^n	59
11.3.2	Taylor Series on Lie Groups	61
11.4	Relationship Between the Jacobian and Lie Derivatives	62
11.5	The Chain Rule for Lie Groups (Version 2)	64
11.6	Compact Connected Lie Groups as Riemannian Symmetric Spaces	66
11.6.1	Invariant Vector Fields: The Geometric View	66
11.6.2	Bi-invariant Vector Fields and Associated Metrics	67
11.6.3	Lie Bracket Versus Jacobi–Lie Bracket	68
11.7	Differential Forms and Lie Groups	69
11.7.1	Properties of $\Omega_r(g)$ and $\Omega_l(g)$	69
11.7.2	The Maurer–Cartan Equations	70
11.7.3	The Exterior Derivative of Forms on a Lie Group	72
11.7.4	Examples	73

11.8	Sectional Curvature of Lie Groups	76
11.9	Chapter Summary	76
11.10	Exercises	77
	References	78
12	Lie Groups III: Integration, Convolution, and Fourier Analysis	79
12.1	How to Integrate on Lie Groups	80
12.1.1	Invariance of the Integral on a Unimodular Lie Group	81
12.1.2	Example: Integration on the Rotation Group	83
12.1.3	Example: Integration on the Motion Group	83
12.2	Integration by Parts	84
12.2.1	Extension to Unimodular Lie Groups	84
12.2.2	Inner Products of Functions on a Unimodular Lie Group	85
12.2.3	The Adjoints of \tilde{X}^r and \tilde{X}^l for a Unimodular Lie Group	85
12.3	Convolution on Unimodular Lie Groups	86
12.4	Decomposition of Integrals on Lie Groups	88
12.4.1	Subgroup-Coset Decompositions	88
12.4.2	Double-Coset Decompositions	91
12.4.3	The Weyl Integration Formula for Compact Lie Groups	93
12.4.4	Separation of Variables	97
12.4.5	Integration on Lie Groups with Multiple Components	98
12.5	Invariant Integration on Homogenous Spaces	98
12.5.1	Conditions for Invariant Integration	98
12.5.2	Convolution on Homogenous Spaces	99
12.6	Global Geometry and Topology of Compact Connected Lie Groups . . .	100
12.6.1	Stokes' Theorem for a Compact Lie Group	100
12.6.2	Betti Numbers, Poincaré Polynomials, and Euler Characteristics for Compact Lie Groups	100
12.6.3	de Rham Cohomology	101
12.6.4	Hodge Theory	103
12.6.5	The Euler–Poincaré Characteristic for Coset Spaces of a Compact Lie Group	104
12.7	Fourier Analysis on Unimodular Lie Groups	105
12.7.1	Group Representations	105
12.7.2	Harmonic Analysis and the Convolution Theorem	107
12.7.3	Separation of Variables and FFTs	108
12.7.4	Operational Properties	108
12.8	The Exponential Map and Representations	109
12.9	Irreducible Unitary Representations for $SO(3)$	110
12.10	Wigner $3j$ Symbols and Clebsch–Gordon Coefficients	112
12.10.1	The Case $c = a + b$	113
12.10.2	The Case $c = a + b - 1$	113
12.10.3	The Case $c = a - b$ ($b \leq a$)	113
12.11	Irreducible Unitary Representations for $SE(2)$	114
12.12	Explicit Results for $E(3)$	115
12.12.1	Induced Representations for $SE(3)$	116
12.12.2	Matrix Elements of IURs	116
12.12.3	Explicit Expressions for $u(E_k; p, s)$	117
12.13	Chapter Summary	122
12.14	Exercises	123
	References	125

13 Variational Calculus on Lie Groups	129
13.1 Optimization on Lie Groups	130
13.2 Derivation of the Euler–Lagrange Equation	130
13.2.1 The Concept of a Variational Operator	131
13.2.2 Variational Calculus Computations	132
13.2.3 Obtaining the Euler–Lagrange Equations by Localization	132
13.3 Examples of Variational Calculus Problems	133
13.3.1 Geodesics on Manifolds	133
13.3.2 The Planar Elastica	133
13.3.3 Finding Approximate Solutions to Evolution Equations	134
13.3.4 Equations of Motion of Mechanical Systems	135
13.4 Sufficient Conditions for Optimality	135
13.4.1 Global optimality in the One-Dimensional Case	136
13.4.2 Global Optimality in the Multi-dimensional Case	136
13.5 Lie Symmetries in Euler–Lagrange Equations and Other ODEs	139
13.6 Parameter-Free Variational Calculus on Matrix Lie Groups	140
13.6.1 Problem Formulation	140
13.6.2 Derivation of the Euler–Poincaré Equation	142
13.6.3 Cases When the Euler–Poincaré Equation Gives Globally Minimal Solutions	143
13.6.4 Sub-Riemannian Geometry, Carnot–Carathéodory Distance, and Stochastic Nonholonomic Systems	144
13.7 An Application: Continuum Models of DNA Mechanics	145
13.7.1 Elastic Rod Models of DNA	146
13.7.2 Minimal Energy Conformations of DNA Loops with End Constraints	148
13.8 Chapter Summary	149
13.9 Exercises	150
References	152
14 Statistical Mechanics and Ergodic Theory	155
14.1 Mechanics of Conservative Systems	156
14.1.1 Lagrangian Mechanics	156
14.1.2 Conjugate Momenta and Hamiltonian Mechanics	156
14.1.3 Properties of Volume in Phase Space	158
14.1.4 Liouville’s Theorem	158
14.2 Stochastic Mechanics	159
14.2.1 Stochastic Equations of Motion	159
14.2.2 Stochastically Forced Systems	160
14.3 Fokker–Planck Equations on Phase Space	160
14.3.1 The Maxwell–Boltzmann Distribution	161
14.3.2 Averages with Respect to the Maxwell–Boltzmann Distribution	162
14.3.3 Ergodic Properties of Some Stochastic Mechanical Systems	163
14.4 Equilibrium Statistical Mechanics of Rigid-Body Molecules	164
14.4.1 Translational and Rotational Brownian Motion of Rigid-Body Molecules	165
14.4.2 Molecular Theory of Liquids	166
14.5 Conformational Statistics of DNA	169
14.5.1 A Multi-Rigid-Body Model of DNA	169
14.5.2 Continuum Filament Model Subjected to Brownian Motion	171

14.6	Ergodic Theory	173
14.6.1	Ergodic Motions on the Circle and n -Torus: Weyl's Result . . .	173
14.6.2	Ergodic Group Actions on Manifolds	175
14.6.3	Mixing and Ergodicity	176
14.6.4	Ergodic Theory and Dynamical Systems	177
14.6.5	Measure-Theoretic Information	178
14.6.6	Measure-Theoretic Entropy	179
14.7	Chapter Summary	180
14.8	Exercises	181
	References	182
15	Parts Entropy and the Principal Kinematic Formula	187
15.1	Introduction	188
15.2	Problem Formulation	188
15.2.1	A Continuous Version of Sanderson's Parts Entropy	188
15.2.2	Multiple Parts	189
15.3	Principal Kinematic Formulas	191
15.3.1	The Principal Kinematic Formula	191
15.3.2	The Planar Case	192
15.3.3	The Spatial Case	194
15.4	Differential-Geometric Derivation of the Principal Kinematic Formula	195
15.4.1	The Planar Case	195
15.4.2	Spatial Case	201
15.5	Examples	204
15.5.1	Example 1: The Planar Case: Circular Disks in Planar Motion	205
15.5.2	Example 2: Spheres and Spatial Motion	205
15.6	Extensions and Limitations	205
15.7	Integral Geometry in \mathbb{R}^n	206
15.8	Differential-Geometric Generalizations of Kinematic Formulas	207
15.8.1	Non-Euclidean Principal Kinematic Formulae	209
15.8.2	Integral Geometry of Squared Curvature	211
15.9	Kinematic Inequalities	211
15.9.1	Kinematic Formulas for Nonconvex Bodies and Non-Haar Measure	211
15.9.2	Bounds Based on Hölder's Inequality	212
15.9.3	An Upper Bound Based on Jensen's Inequality	213
15.9.4	A Lower Bound Inspired by Jensen's Inequality	214
15.9.5	A Geometric Version of the Cauchy–Schwarz Inequality	214
15.9.6	Bounds Based on Approximations of $u[\cdot]$	216
15.9.7	Bounds Based on Noncommutative Harmonic Analysis	217
15.9.8	Multi-Gaussian Approximations	218
15.10	Bounds on Integrals of Powers of the Euler Characteristic	219
15.11	Kinematic Formulas for Articulated Bodies	219
15.12	Parts Entropy	220
15.13	Entropy of Loosely Connected Parts	221
15.14	Chapter Summary	223
15.15	Exercises	224
	References	225
